## The Honeywell Visicorder Oscillograph tests liquid hydrogen systems in "space"

The Astro Division of Midland-Ross Corporation uses a Model 1108 Honeywell Visicorder Oscillograph to measure and record temperatures and pressures of their new cryogenic test facility at Columbus, Ohio.

In order to simulate conditions as they exist in space, a wide variety of temperatures and pressures must be measured accurately and dependably. The 1108 Visicorder provides detailed test data resulting from tests on missile hardware and systems which operate on liquid hydrogen, liquid nitrogen, and other cryogenic fuels.

The new Astro facility includes a 300-gallon Dewar, 17' deep and 4' in diameter, that accepts components for static or dynamic test up to 40 ton size. Pressures range from 1 psig to 75 psia, and flow rates vary broadly because of the size of the test system.

However, a pioneer in the science of oscillography—Elliott, a subsidiary of Vicksburg Oscillographs—has worked hard to make test measurements easy. The 36-channel Model 1012 is the most sophisticated, the 8-channel 1400 meets the basic per channel. In between are the 6- or 12-channel 9000; the intermediate 24-channel 1108; and the compact

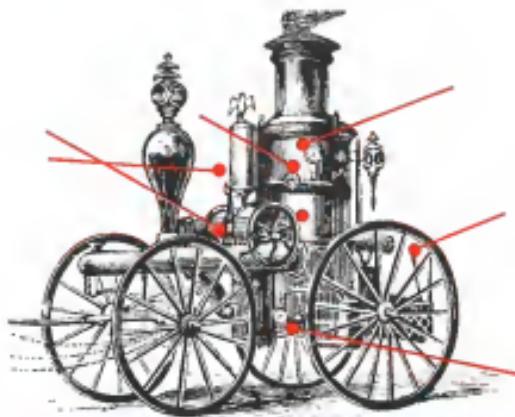

24-channel 1508. Most models record at frequencies from 100 to 1000 cps and all have many extras, conventional operating features.

For details, write Minneapolis-Honeywell, Denver Division, 6509 E. Dry Creek Road, Denver 10, Colorado.

### DATA HANDLING SYSTEMS

# Honeywell

## FORERUNNER OF REACTION CONTROLS?

Wondering what this ancient pump has in common with reaction controls for aerospace applications? They're both based on the science of fluid dynamics.

Midland-Ross has been in aerospace applications during back to the early '40s.

Current projects under study or development at Vicksburg Aerospace Division include: nozzle/velocity correction and reentry staining, attitude control systems and components, solid propellant rocket attitude control systems and components and propellant/turbogas secondary injection.

For any of these applications, the program manager has at his disposal the specialized skills, experience and facilities available only at Vicksburg. Groups of specialists in aerothermodynamics, fluid flow, sound, stress, vibration, instrumentation, systems analysis,

valve development, materials and processes provide added assurance of success in attaining all the program's goals.

Product developments include a high-temperature, 10-arcsecond rated motor (3000) and a 1-gallon street atomizer (Model 1012). For more details about these and other recent aerospace developments write for Bulletin A-1100 "Newspaper Article for Aerospace Div." in Vicksburg Aerospace Division, P.O. Box 100, Vicksburg, Michigan.

**SPERRY HELMET  
INTEGRATED  
SIGHTING AND  
CONTROL SYSTEM**

The only universal sighting and control system for use with all Army aircraft armament systems.

- 20 MM Weapons
- 40 MM Grenade Launcher
- 2.75-inch Rocket FFAR
- .30 caliber Machine Gun
- T-62 MM Machine Gun
- SS-11 Rocket ATGM
- Disposable Container

**Deadeye:** The Sperry Helmet Integrated Sighting and Control System (HISCS) is the only such system for use with all Army aircraft armament systems. It permits the helicopter pilot to control—securely, automatically and simultaneously—both his armament and helicopter. Employing a helmet collocated vehicle sight, and control packets, HISCS is a natural sighting and control system suitable for flexible armament. The operator controls the weapon firing line. □ Successive 2.75-inch Rocket ATGMs fire from a helicopter at Pb Brdg demonstrating HISCS effectiveness for fixed armament as well. □ Response: HISCS fails to lock on target has been checked at under two seconds. □ Also, a magnification mode is applicable to the SS-11 Rocket ATGM. AIR ARMAMENT DIVISION, Sperry Gyroscope Co., Great Neck, N. Y.

## Saturn Automatic Checkout System

## How the Friden Flexowriter® controls its man-machine communications

**By Jerry Stacum**, Manager, Fiberoptic Engineering Services, XANTEN Systems, Folsom Bell Electronics, Los Angeles, California

"In the automatic mode, under computer control, the Fluorimaster provides such things as fixed copy outputs of test results; utilization of CIBD and NIDG GO measurements with their identification powers; type and of test programs that type out of the annual test steps being measured; and type in and type out of specimen instructions where manual intervention is required.

In the manual mode, the test stations are off line from the computer complex and the Flexowriter runs in the full mode of continuous communication with the test stations. They provide means for sending data via the keyboard or the Flexowriter's tape reader and allow each operator to manually input signals through a program routine, continuous cycling for communication purposes, and the manual encoding of station status events for confidence check of hardware and programming.

In the single tap mode, the Flexowriter and its desired debugging of other programs or hardware by the computer are connected directly to memory, with the single step represented graphically by the single step represented graphically by the single step.

In addition to these facilities as an integral part of the system, means are provided for easily switching the PDP-11 into off-line operation for the more conventional usage such as listing, preparing program tapes, and generating reading tapes.

The versatility of the Flexarmizer as an input-output medium, a data-link and data-center, makes it an invaluable tool in the design and operation of any control system. To fully investigate the Flexarmizer's versatility, call your local Fisher Systems man. Or write Fisher Inc., San Leandro, California.

And, should you see fit using the *Fireworks* as an application you would like to share with your fellow engineers in these pages, just write and tell us about it. Address your application story to **Editor**.

## Decision-Making: Hostile or not Hostile?

A few years ago this decision was relatively simple. The action that followed was relatively simple. Today the consequence of this type of decision making can be disastrous, affecting world-wide finance and security. The decision may still require an amazingly complex series of intervening decisions and controls to make these compensated-time decisions, communicate via man-machine systems which provide information processing assistance. The development of these large systems is the work of journals, engineers and computer scientists in the Science Development Conference.

process. The system is then concern, not the minor details of hardware. Specifically, they contribute in these day satisfying the requirements of the system, symbolizing the system, interacting the computer with the system, testing the system, evaluating the system. Throughout they tend to optimize man-computer relationships and to develop a system which gives and changes with the needs of the decision-makers who use it. Human factors contribute, operate human-centred activities, systems-oriented approach and computer interaction is interested to cause a

## Remember the DC-1?

#### LINE OF THE DAY FOR ALL AGES

Wiederblüht Deutsche See-Bucht

...and Barber-Colman was there!

Remember the early '30s? The factories of modern transports were just taking off then. In 1933, Douglas Company flew their first airliner, the twin-engine 12-passenger

ger DC-1— quickly followed with the 14-passenger DC-2 in 1934. The 21-passenger Douglas DC-3, introduced in 1935, proved so amazingly popular that it was carrying the bulk of American domestic air traffic by 1938. Most famous and longest-lived aircraft ever built, the DC-3 was in service for 30 years.

maximum altitude is 40,000 ft, the DC-3 had a cruising speed of 185 mph, and a range of 1300 miles. Among many innovations that gave their fleet a distinct advantage were wing flaps, hydraulic nose contracts.

For example, the DCL-3 from the older generation of aircraft has a fan, a heat exchanger, and a Barber-Götsmark thermostat to help control cabin temperature.

...and to make sure that enough safe places *do* change?"

### The smallest — lightest — fastest — snap-acting thermal switch ever!

**Klixon® 38T** miniature snap-acting thermal switch offers a new dimension in temperature control—weights 10% less... responds five times faster than comparable thermal units!

**Weight only 0.4 gm.** Low thermal mass explains why the Klixon 38T Series hermetically-sealed, snap-acting thermal switch responds so much faster than its nearest competitor.

**Evaluate the switch.** This 5051 "Temp-Spec" temperature tester is rated up to 100°C. 12Vdc/100mA. Use for 5,000 cycles. Temperature range is -100°C to 212°F open and closed temperature rise. Thermal resistance is 5-2000°C at 21G. Welded seal guards against hostile environments for terminals and assembly.

**Consider these applications:** ...as temperature limiters and/or monitors in printed circuit boards, computers, thermal barriers, heat sinks, solid propellant applications, etc.

**Write today** for bulletin DS-PRT-12. Application kit including two operating samples at 105°F (43°C) plus one thermocouple sample available at \$15.00.

Out of Ryan's spectrum of capabilities:

## FIRST IN V/STOL

### New V/STOL team-mates for battlefield mobility

The most experienced specialist in high speed V/STOL aircraft, Ryan is designing and building the Army XV-3A lift-tan aircraft under contract to General Electric. This lift-tan concept will provide greater payload/range than any other high speed vertical take off and landing configuration. Ryan is also working on the Vought-Midwest Ryan XC-142A in-service transport—the first U.S. V/STOL aircraft scheduled for operational evaluation. This lift-vest aircraft is designed for a VTOL payload of 8,000 pounds or 32 troops. Once both V/STOL aircraft can be widely dispersed and concealed at advanced "soft bases" they add a new dimension in survivability. And teamed together, they also gain battlefield mobility by giving the field commander quicker reaction, better target location, improved communication, and close-by tactical and logistic support. Ryan is also involved in chapter integration systems, jet target drones, fire control vehicles, terrain landing systems, space radar systems and space structures. Your inquiry is invited on how Ryan's spectrum of capabilities can help solve your Space Age problems.

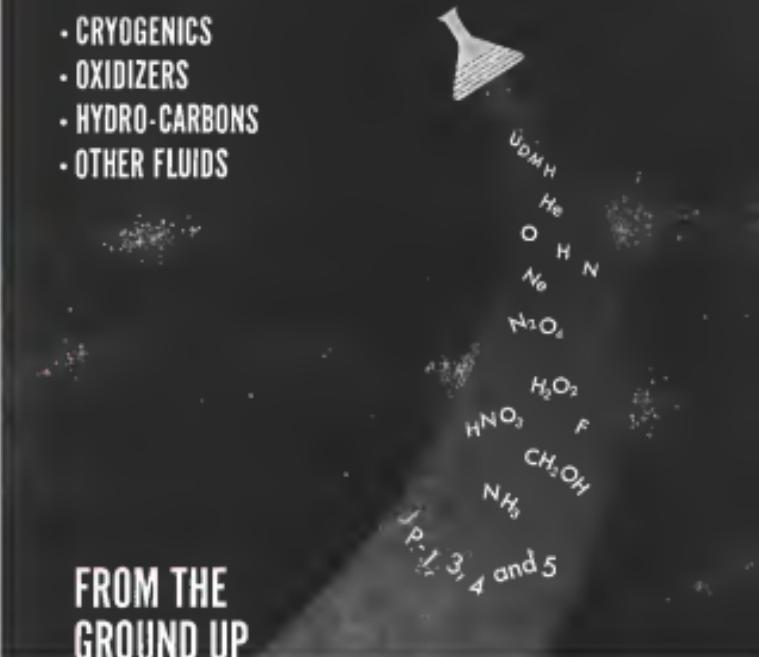

RYAN AERONAUTICAL COMPANY, SAN DIEGO, CALIFORNIA

**RYAN**  
AERONAUTICAL COMPANY

RYAN XV-3 VERTJET, world's first V/STOL aircraft, was developed under Air Force and Navy contracts dating back to 1948. The aircraft is the first aircraft to demonstrate feasibility of vertical jet take off with transition to level flight.

After 20 years of the toughest service...

# These World War II Onan Generators are **STILL GOING STRONG**

1943

1963

Isn't this the kind of service you want when you specify electric plants?

Our Parts and Service Department regularly receives orders for parts for Onan Plants manufactured for WW II use. It is obvious that many of the hundreds of thousands of military generators built in the early '40's are still being used all over the world.

Today's Onan Electric Plant is the better product. With Overhead Valve engines, state-of-the-art magnetic generators... twenty years of continuous design improvements. But the standard is still the same: the best product if is possible to build from the performance,

durability, dependability standpoint.

In addition to electric powerplants with 5 KW to 230 KW, Onan can also supply air-cooled engines 5 to 40 HP, gas, gasoline or diesel fueled magnetic generators, engine compressors, line transfer controls, transformer starters.

We hope you'll give us an opportunity to talk to you soon about these products and H & D specifications. Write Government Products Department, 2515 University Ave. S.E., Minneapolis 14, Minnesota.

air-cooled engines 5 to 40 HP.

## From little systems...mighty systems grow

We designed it that way. Each function in the solid-state 60A radio carrier system can be bought as a separate equipment package, so you can start with a small system and keep adding as requirements expand. Without buying more equipment than you need.

For example (reading left to right), you can install a 12 channel group that is completely self-contained—engine or power, or full 12 channel increments up to a 60 channel system without intergroup equipment—continue to expand up to a 120 channel system, were the intergroup equipment is added—and finally, utilize this equipment in a heavy-duty system capable of handling up to 600 channels.

Because of the "open system" design, light-and-heavy-duty terminals working together are always compatible, and need

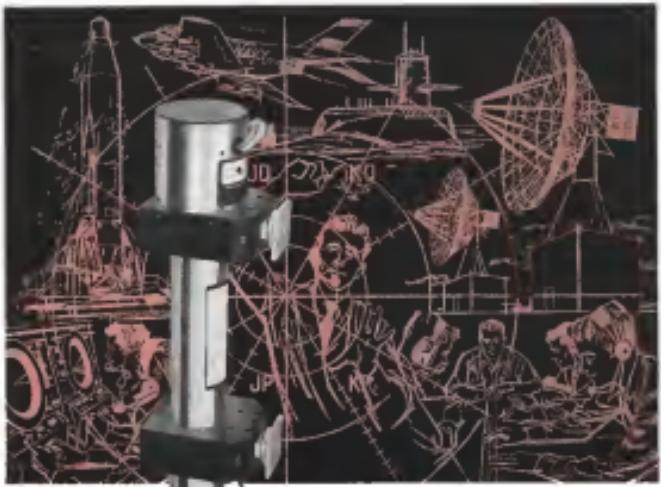

such uses more of the same basic equipment, spare units are kept to a minimum. Full synchronization is available, and most configurations are interoperable with WBS "L" and carrier equipment using CCITT representations.

If you need a radio carrier system that can grow... or one that can fit a variety of communications needs... we'd like to tell you more on 468. Call us for details. Lenkurt Electric Co., Inc., San Carlos, California. Government Sales Office: San Carlos, Calif., Washington, D. C., Rome, N. Y., Santa Monica, Calif.

### how this tube got a good name

Less than three years ago, Microwave Electronics Corporation delivered its first metal ceramic traveling wave tube. Today MEC has a broader line of metal ceramic TWT's in field operation than anyone else, including some of the biggest companies in the electronics industry. Why has MEC been as rapidly accepted by military systems designers, the military user, and industrial instrument and system builders? **7** Because MEC tubes work when the customer gets them. MEC has one of the highest acceptance rates in the industry. **2** Because MEC tubes operate longer. Users report 4,000 to 6,000 hours field life; our own life tests exceed 10,000 hours. **3** Because MEC will tackle the tough jobs and do them in a hurry. Any socket where there is a problem in life, reliability, or controlled characteristics. **4** Because MEC offers production tubes with truly reproducible characteristics—the result of engineering skill plus careful fabrication. **5** Because MEC tubes can satisfy critical military environments, such as MIL-E-5450 Class II. **6** Each year MEC has substantially broadened its product line in terms of frequency, power and noise figure. From R & D this year, for example, came a 200-watt pulsed power TWT, matched gain tubes in S, C, X, and Ku bands, and a high power, low noise TWT operating in X band. And, of particular note, a field operational traveling wave mixer using closed cycle refrigeration. Of these, and other developments, more later on these pages.

Excellent opportunities exist for qualified engineers, design engineers and scientists at MEC. Call or write Dr. Stanley P. Kaled, president, for an appointment. An email appointment available.

# READY FOR 400-MPH TAKEOFF

Aircraft tire dynamometer

The most advanced tire testing facilities in the world are now operational at B.F.Goodrich. Equipment enables the Company to perform all its own qualifications to meet advanced jet tire specifications.

For example, the giant dynamometer above develops 10,000 horsepower, and can test tires at speeds as high as 400 miles per hour, under loadings as high as 100,000 pounds per tire. The machine simulates any landing or takeoff condition. (Safety horns are retracted for photographic purposes.)

**B.F.Goodrich**  
aerospace and  
defense products

At the Test Center engineers can check acceleration, deceleration, simulate operation during taxi, takeoff, and landing, and test under both extreme cold and hot conditions.

Pioneering of this type is one of the reasons B.F.Goodrich is the leader in aircraft tires—and has introduced fabric tread tires, new designs, and new materials. Speedy BFG for tires you can depend upon. The B.F.Goodrich Company, Aerospace and Defense Products Division, Dept. A.B. 88, Akron, Ohio.

## The Atlantic Fare Battle

The current battle over North Atlantic airline fares concerns basic money far more significant than the money immediately at stake. These are:

- Will international air transport grow at the rate that the combination of jet equipment and efficient airline management makes possible, or will it artificially be stalled by government action to the pace of the last efficient operator?

- Will the U. S. State Dept. permit U. S. air travelers to reap the dividends that are now being offered by efficient airlines in the form of lower fares, or will it continue to compel these U. S. citizens to pay what is in effect a subsidy, concealed in the tickets they buy, to some air efficient foreign airlines?

International airlines have always been divided into two categories: those who operated primarily as a commercial enterprise and were dedicated to the goal of making a profit, and those who were operated primarily as a flag-flying enterprise based on a substantial and perpetual government subsidy. The advent of jet transports widened the gulf between these two types of international airlines until the present dispute arose. This gulf will get wider and the issue more acute despite what ever temporary patchwork may be used to avert the present crisis.

The tension and strain produced by this divergence have generated a series of international rate wars in the jet age, beginning with the now historic IATA traffic conference of 1958 at Geneva. Most of these wars can traced the engine to which side should be lowered, and they were eventually compromised without changing the inevitable trend toward lower fares. The current crisis is caused by the determination of Great Britain and its supporters to reverse this trend and raise rates on the North Atlantic.

### British Shortcomings

It is a matter of record that the government-owned British Overseas Airways Corp. has experienced only a measure of success in its North Atlantic operations, caused in part by the failure of the British aircraft industry to produce transports that could compete successfully with U. S. designs, and in part as a financial and operational structure that BOAC Chairman Sir Matthew Stirling described at the end of his first year in office as "bloody messy."

There are now some 18 international airlines flying the North Atlantic, and under their bilateral agreements with the U. S. nobody challenges their right to tap the U. S. market. But what is challengeable, and we think right, is their claimed to operate as efficiently as they please and pass on a good share of their subsidy recompence to the U. S. air traveler. This is really what the British government is fighting for, and this is what the U. S. Civil Aeronautics Board and Congress are op-

posing so strongly, despite the State Dept.'s policy of "peace at any price."

CAB Chairman Alan Boyd has been steadfast in his opposition to the British attempt to turn back the clock of airline progress, and we thoroughly agree with his interpretation that:

"...the passenger is not responsible for the amount of traffic generated by the airline and should not be required to pay for empty seats." He has also noted that traffic and earnings will continue to improve on the North Atlantic in 1963 and "we are unable to convince ourselves of the wisdom of a fare sacrifice."

It is the U. S. traveler that is being stuck with the largest share of this subsidy through high rates demanded by the British, who as the users of the free boat contingent also have taken on the role of champions of corporate inefficiency. U. S. citizens accounted for slightly more than 80% of the two million people who flew the Atlantic in 1962, while U. S. airlines only carried about 35% of the total traffic. In all honesty, we must note that not all foreign carriers are fighting for high fares [see p. 34], and some of them are pricing just as high as U. S. airlines for a lowering of rates as far as increasing efficiency and traffic permit.

### American Dollar Flow

In addition to the traffic support U. S. citizens provide to foreign airlines, they also deposit abroad a multi billion dollar annual interest egg that plays a major role in the prospering European economy.

The high fare contingent led by the British produced some rather outrageous threats of recourse against U. S. carriers as their sole successful attempt to turn the tide tide. But we suggest to them that they may have won a Pyrrhic victory. For they will find that the U. S. citizens—on less now than in 1976—or not as popular as the State Dept. Nor are they duly elected representatives in Congress. Already there is a rising tide of indignation on this side of the Atlantic over the British bludgeoning. We predict that it will continue to rise until a new international fare policy is legislated by this government to protect its citizens from the subsidy levied on them by some less efficient foreign airlines. If certain conditions are to be applied the balance favors the U. S. by a wide margin, if all its officials have the courage exhibited by Mr. Boyd and his successor, Robert Murphy. It is evident that the International Air Transport Assoc. is nearing the end of its role as the prime formulator of international air fare policy, and that this role must be taken over by the government themselves. IATA can continue its useful function in translating that policy into tariffs and operating as an international clearing house and other useful service functions.

—Robert Hots

## Self-Reliant\*

**SPS WELDING**—Shown here is an example of a valve seat before welding (left), after hard surfacing with a new wear-resistant alloy (center), and after final machining (right). All operations performed in the SPS plant.

\*On the theory that too many cooks spoil the broth.

SPS capabilities for manufacturing precision-machined parts are completely integrated. From the time the raw material is received until the finished component is shipped to you, SPS controls every phase of manufacture and testing. Our supporting activities for precision machining include welding, thread rolling, heat treating and plating.

A word about welding. SPS performs shielded metal arc, gas metal arc, and gas metal tungsten welding with both manual and automatic equipment. X-ray, magnetic particle, and ultrasonic inspection assure the excellence of that work. The illustrations above show a recent example of expanded polyethylene hard surfacing.

Because of our insistence on complete control of the entire project, we are able to meet any standard you set for precision machined parts. **STANDARD PREISHED STEEL CO., PRECISION FABRICATION DIVISION, PRECISION MACHINED PARTS SALES, Jenkintown 33, Pa. where reliability replaces profitability

Welders being checked by atmospheric pressure monitor.

One of many controlled atmospheric heat-treat furnaces.

SPS plating facilities provide 20 different types of finishes.

Threading rolling from .048-in. to 6-in. diameter.

## WHO'S WHERE

### In the Front Office

Thomas F. Dorn, vice president, North American Aviation Inc. El Segundo, Calif. Mr. Dorn is president of President J. L. Ahern.

George F. Stoll, president, and Charles F. Housman, Jr., executive vice president of The Steelfield Corp., Dallas, Okla. Steelfield chairman and two managers reelected to the board. Mr. Stoll succeeds Louis Polk, who continues as a director and also a vice president and treasurer of Steelfield.

Malvin F. Mays, president and general manager, Technology Instrument Corp., of California, Novato, Calif., a subsidiary of Bourns Instrument Corp.

Dr. Andrew Farn, vice president and general manager, Hughes Space Corp., Los Angeles. Dr. Andrew Farn, and Dr. Howard Wernick, vice presidents, also reelected.

Dr. H. J. Smeltz, vice president, Technical, Hughes Corp., and general manager of Hughes' Electronics Division, Dallas.

Barry B. Dukakis, regional vice president, Europe, The Middle East, Asia, Africa, South America, Australia, and New Zealand, in London, England.

Stan G. George R. Stanley (USAF) with a doctorate in aeronautics, of Edwards Aircraft Corp., Mountain View, Calif., elected president, Real News with the best of Real Industries for China, 1980.

Joseph E. Franklin was president and managing company director, Andover, Inc., Southgate, Calif.

Norman F. Deakin, reelected to the presidency, Headquartered Bay of Islands Aircraft Corp., Winkfield, Essex, Conn.

D. G. Johnson, a division director of S. Smith & Sons (England) Ltd., and a member of the Board of Directors, Jack Knibbstone director, reelected.

Alfred E. Johnson, vice president, Paul F. Brinkman, vice president, Verne Farn, Corp. El Segundo, Calif. Also, Mrs. G. Kashi, Philadelphia overhauled her office, elected a director of Aeronautics.

Dr. W. Powers, vice president, director of research and development, Research Corp., New York, N.Y., now president of the company's engineers and development group. W. L. Gossman, appointed supervisor of engineers, to replace Mr. Powers.

Edward K. Clegg, vice president, Sales and Service, Thomas A. Edison Foundation, Inc., New York.

Henry E. Hockenberry, a vice president, Pilkington Corp., Philadelphia, Pa. He now serves as general manager of the Consumer Electronics and Electronics Div.

David S. Karp, vice president and general manager, K. L. Dornauer Corp., Maclay, N.Y., and A. Richard Weller, executive vice president.

Mr. Franklin, Ronald D. Coss, vice president director of engineering in California Computer Products, Inc., Andover, Calif.

John P. Brady, executive manager in the sun, precision machining, Three West Airline, Inc.

## INDUSTRY OBSERVER

►Studies of estimated Mercury mission costs have shown that a flight of at least 100 hr. duration could be made by adding 300 lb. of consumables to the basic McDonnell-built capsule. Most of the added weight would be attributable to batteries. But chassis men say that National Aeronautics and Space Administration will decide to make another Mercury flight.

►Non-astronautic industry experts see very little growth potential in the magnetic resonance detection (MRD) market currently used to confirm the presence of a submerged submarine. Although the market is account, it is extremely limited in effective range. Current types of deep-diving submersibles should be able to run below its useful detection depth. Long-range sonar systems at the surface and sonar effects a submarine detection system.

►Techniques for the application of lasers to an optical navigation system will be studied in a research and development program planned by USAF's Astronautics Systems Div. ASD is seeking qualified sources for study of reliable laser modulators and heterodyning techniques and laser frequency control using Zernike holographic techniques.

►Rumors continue to circulate for a small of defense contractors in articles published in *Investor*, one of the official government newspaper. Design bureaus have been queried on licensing to "gather information on building dirigibles." One source points out that the lighter-than-air vehicles could be used for carrying passengers and bulky cargo, for fastening lighting, astronomical and atmospheric observation, aerial photographs and long-haul surveys.

►Starship 101, the atmospheric, nuclear, hydrogen fuelled, will be fitted with three-stage finned boosters planned to be the primary and orbital interstage to help stabilize the aircraft after an atmospheric landing. New experience with the finned boosters has also shown such landing as emergency exits procedures because of the danger that the SLS-101 will roll over 3 to 70° when. Correct procedure is to keep lift on the entry to stabilize the aircraft. If both engines have failed and the finned boosters have been landed deadstick, it can capture in 30 to 45 sec.

►Program evaluation in Advanced Research Projects Agency's high-acceleration booster acquisition (HABA) is expected to be completed by May 10. Program representatives preferable will call for 900g acceleration and a peak-lift landing rate of about 2 g/sec. This compares with slightly higher landing rates required for a composite-propellant combination at launch for the double-base propellants mixture already selected for the Sprint anti-missile missile. Very large solid-propellant booster boosters will under development or in feasibility will have landing rates near 6 g/sec.

►NASA's Lewis Research Center will support industry investigation of components for materials for space electrical power systems. Tasks will include compilation of material properties based on state-of-the-art experimental determinations of several additional critical parameters for selected materials, development of fabrication techniques and special environmental testing which will include vibration damage studies. Studies, bids for the task were submitted April 18.

►Industry proposals to extend Apollo reusable capability by using high-energy propellants and advanced aeroshell designs are being evaluated at NASA's Marshall Space Flight Center. Two other plans are contemplated. First will include propellant combustion and aeroshell capable of being operated by 1970; second would be a similar task with a 1975 date.

►Turbol self-propelled rocket motor for the USAF Boeing X-20 (Orion) is being tested for its Preliminary Flight Rating Test (PFR). Loaded motor weight about 3,300 lb. It is an in-bore motor, never jetted, and will be used in three runs. In each run it will accelerate the Orion from its B-52 mother plane. In later suborbital tests it will be the short burns for the manned vehicle. Ultimately, it will serve as a test stage for powered flight.

## A Metal Problem...With Complications

The issue is **time**...the girl impotent...and a rough metal problem has to be solved **right**. Pressure that breeds alertness that might not notice if this hunked engineer had up-to-date information on **HAYNES** alloys.

Haynes alloys solve tough metal service problems—severe abrasion...severe metal-to-metal wear...corrosion...difficult or impossible lubrication...high temperatures. They are available in any shape, any quantity, any size. As finished parts...ready to use...or as rough castings, forgings, bar stock, sheet, plate, or wire.

Our 32-page properties booklet details the characteristics of 15 Haynes alloys. Address inquiries to Union Carbide Specialty Company, Division of Union Carbide Corporation, 270 Park Avenue, New York 13, New York.

## Washington Roundup

### The Perkahoo Curtain

Government's new-sys-sett, new-redo approach to the reporting of Russian space failures is finally getting a thorough going-over in Congress. The House Government Information Subcommittee last week, despite intense National Aerospace and Space Administration lobbying, got something in Delaney Dept. of Defense's annual Soviet Space Operations Report (Senate Report 174 AW May 6, p. 31), despite the fact that Delaney, Dr. George E. Strupin, Jr., as who he was, has 177 congressional critics who feel he has been less than honest in his reports. Strupin, and even questioned his credibility to serve as assistant administrator for technology utilization and policy planning. Strupin is a neophyte.

Subcommittee will call NASA Administrator James E. Webb and Deputy Administrator Hugh L. Dryden and Assistant Secretary of Defense for Public Affairs Arthur Schlesinger to explain the question further. This, in particular, interested in how Webb was able to report on quickly and in great detail last September on the Russian failures, and why do NASA can get this kind of information if it doesn't pass it on to the public regularly.

### Airlines Get the Boyd

One of the first public criticisms of the airlines by a Civil Aeronautics Board member on a subject and directly related to traffic was last week from CAC Chairman Alvin S. Boyd. Testifying on the North Atlantic flight time (see p. 34), Boyd said: "I think one of the most shortsighted arguments that our carriers have ever made was to insist to get express, constant regulation of flight times. Now, we have these new hours of flight. They have sought to develop a double standard and I have no sympathy with their position whatsoever. That will not be able to go anywhere that's right to go and they need to stand up and say to everybody else competing with them, 'See, you can't name us!'"

NASA last week settled the question of whether to live up to a number of instructions for broadening studies at its Merritt Island, Fla., launch complex by breaking the work into four basic communications, base services, launch support services and administrative and management services. Twenty-one contractors were invited to a conference on the management contract May 27 at the Launch Operations Center at Cape Canaveral. This will be awarded July 15 and competitions for the other categories will begin about that time.

### Program Definition Plan

Postponed is about to expire "program definition" plans for a broad range of advanced technology projects under a directive to be issued next month. It will spell out the types and dollar size of contracts to be awarded. Only three major program briefs need this phase so far: T-3, orbital medium-range ballistic missile and the Lancer ballistic missile. Dr. Harold Brown, defense director of research and engineering, told the House Military Operations Subcommittee last week that the purpose of a definition plan is to provide mutual understanding between government and contractor on "what is wanted, how to proceed and what it will cost in money and time."

Legislation to keep the Arms Control and Disarmament Agency alive probably will be passed by Congress, but it is making a very low priority. Under present law there is a \$10 million ceiling on its budget. Of this, \$6.5 million already has been appropriated for Fiscal 1962 and Fiscal 1963, and the President has added \$1.5 million for Fiscal 1964. Senate Foreign Relations Committee last week passed a bill to lift the ceiling but has taken no action. House has not yet taken scheduled hearings.

### Boeing Reorganization

Boeing Co., whose autonomy in recent years has been Air Force blemish, last week established a Military Aviation Systems and Transport division into the Aerospace Division. Dr. Elmer E. Knutson, vice president and general manager of the Transport Div., will head the new division. He will be responsible for overall operations at Seattle and Boston, Wash., and Wichita, Kan. The changes and the move would not affect its ability to build F-105 fighters if the current Senate investigation (see p. 37) should result in a build-and-compete with General Dynamics-Grumman.

Navy, whose first study of seaborne-purposed carrier was suggested (AW May 6, p. 35), has now assigned the task to Rear Adm. T. F. Connolly, director of the strike warfare division under the deputy chief of naval operations for operations.

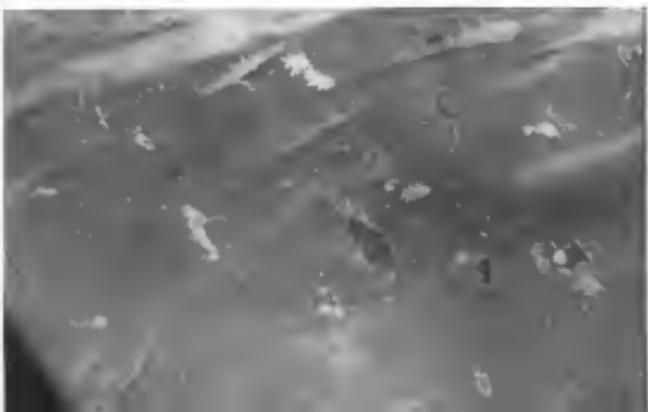

Art Fitter and Navy, still arguing over definition of tactical air missions (AW May 6, p. 35), went through a hellish-mocking session last week in the hands of Dr. John L. MacLean, deputy director of defense research and engineering for tactical air warfare systems. Result: A scrubbed set of guidelines for tactical war-gaming and flight testing.

Joint Congressional Atomic Energy Committee will begin open hearings June 1 on fallout induced by U.S. and Soviet tests last year, fallout now in the atmosphere and programs to develop radiation countermeasures.

—Washington Staff

**VIEW SUSTAINABLE CHILI FROM SPACE** of the vast reaches of the Himalaya mountain (above) was photographed by Maj. Gordon Cooper during his MA-9 flight with a 78-mm. lens held outside. Below, river, terraced, users, and other landscape features are visible (below) as a platoon near the Himalaya probably the Tibetan plateau.

## NASA Weighs MA-10; 6-Day Flight Urged

Decision due this week; open-end mission could replace two early Gemini efforts and save six months.

By Edward H. Kokens

Washington—Key National Aeronautics and Space Administration officials have agreed under pressure from within the agency to defer until this week a final decision on another Mercury flight. The added flight is now being proposed as an open-end mission that would last as long as six days, and possibly give six months to the second flight program by eliminating at least two short-duration Gemini flights.

President Kennedy said at his May 22 news conference that the Mercury astronauts, who strongly favored a Mercury-Atlas-10 mission, discussed the flight with him. He apparently was impressed with their arguments. He said he will talk to NASA Administrator James E. Webb about it this week, but will not interfere with the decision.

Maj. Webb and Ernest Holmes, director of amateur space flight programs, had decided by May 20 that USAF Maj. Cooper's MA-9 flight, Mercury-Atlas 9 mission, June 21, effectively closed out the Mercury program, and the named flight effort would now go to Gemini and Apollo.

But on May 21, after the Mercury program team and Marshall Spacecraft Center officials had arrived here for Cooper's reception, (see p. 24) and discussed the MA-10 with them, both Webb and Holmes were persuaded to withhold their decision until the preliminary assessment of Cooper's data is completed. Final closure on MA-10 could come as early as May 25.

Webb and other NASA decision makers have held firmly to the position that MA-10 will be scheduled only if there was a failure or distinct gap in data returned from MA-9 (AW May 13, 16). Webb said shortly after the MA-9 flight that a preliminary look indicated that the data was not anomalous. But it has now been assessed and the question is now reopened.

Webb's assessment is that the success of the U.S. space program depends upon the Saturn C-1 launch vehicle and the Apollo spacecraft system. He feels that another Mercury flight would distract money, time and manpower from Saturn and Apollo.

Six of the seven original Mercury astronauts, including Cooper, had the opportunity to tell President Kennedy the night of May 21 at a private party he had for them—Majors Li, Col. John H. Glenn was absent. At his conference the next day, the President said in response to a question, "I think they [the astronauts] would like [MA-10] to go on." I have discussed it with Maj. Webb, NASA should make the judgment and will make the judgment and I would not interfere but this is a fact that a flight is useful and that the

agreed to repeat Cooper's 23 orbits and then to continue as long as circumstances dictated and the policy of the agency required.

Studies completed immediately after return MA-9 indicate the mission could last as long as 96 orbits or 144 hr. A 72-hr. mission proponents feel could be flown in September. An open-end flight would require six more months of preparation. The proponents further argue that there is a possibility that an 18-day flight in October represents an opportunity, even though it may be thin, for showing U.S. capability at this time against Russia's.

There is considerable speculation that Russia has the capability for a 12-day uncrewed mission, and a long duration flying mission flight of that duration.

Although Cooper's MA-9 flight is considered to be the last Mercury flight, the team has represented a number of problems which should be solved before extended duration Gemini missions are attempted. This causes the team to feel there are effective arguments for an other Mercury flight, such as:

- Food handling and eating. Cooper ate only 400-500 calories of food, mostly dessert during his flight. He had difficulty in rehydrating the dehydrated food. Longduration flights require considerably more calorie intake and a more balanced diet.

- Waste disposal and water balance studies. Mercury officials are unsatisfied with the system for collecting urine samples and the way in which the crew drink water and how it is excreted.

- Propulsion control. Cooper had a fear that there was an excessively high drain on the battery system from a short circuit in the attitude gyroscopes, which would inhibit the nuclear navigation system from functioning at landing.

- Weightlessness-effects analysis. The team would like more data on the metabolic processes after long duration space flight. Cooper experienced about 75 sec. of dizziness after he emerged from the capsule, but recovered in just after a few steps.

- Operational readiness. Marshall Spacecraft Center turns the effects of 18 months' absence on the performance, launch, orbital, reentry operations and mission control teams.

Against these arguments is the point often expressed by Webb that NASA should devote its energies toward and money to Circus, Saturn and Apollo. He feels that these programs are critical not only to national honor leading, but also to space travel, basic exploration and glaciology flights, since little hard ware for advanced research will be flight tested and qualified to Apollo.

### Cosmos 17 Launched

Moscow—Sovietosat satellite in the

Cosmos series was launched May 22 by Soviet Russia into an orbit with an initial radius to the equator of 463 km., apogee of 912 km., perigee of 162.9 km., and period of 94.82 sec. It was the fifth Cosmos satellite batch announced this year—the second in a similar orientation

## B-52, B-47 Modifications to Cost \$2.4 Billion

Washington—Defense extended use of the Boeing B-47 and B-52 bombers to require a modification program expected to cost a total of about \$2.4 billion, the Air Force has told the House Defense Appropriations Subcommittee.

B-47 modifications are expected to add \$732.3 million through Fiscal 1994, another \$1.1 billion is to be spent through Fiscal 1995, for a total of \$899.5 million.

The last B-47 was delivered to the Air Force in February, 1977. All total, 2,604 B-47s and B-52s were produced. Boeing B-52s are to be retired by the end of February, 1993, with 1,221 aircraft.

To date about \$400 million have been spent to modify B-52s. Another \$1.2 billion will be spent between now and Fiscal 1996, according to Lt. Col. George Blodner of the USAF's maintenance engineering directorate. The last B-52 was delivered to the Air Force in October, 1962. All total, 744 B-52s were produced with 636 of them still in the operational strength. According to recently released information, Maj. Gen. Robert J. Fiedman, USAF deputy chief of staff for programs and requirements, and on Mar. 20 that "approximately" 17 B-52s have reached unoperational, and no Mar. 20 that "approximately" 17 B-52s have reached unoperational, with 76 B-47s.

Gen. ex," he said. He also thought the phenomenon he was to experiment with was not "operationally sound" because the speed of the capsule and the pilot overcame the staying light switch and shot a timer for immediate reconnection.

Casper arrived half past one in the month of June. He intended that he slept a total of 5½ to 6½ hours in increments of ½ to ½ hour because he was experiencing difficulties with the nose control system and had to make periodic adjustments.

At one time, Casper said, he awoke and found his arms dangling "not in front of me." The usual Soviet orbital pilot, Glebennikov, who reported finding him and his wife the day after Casper and his two discoverers were "discreetly" particularly because there was a lot of verbiage up there for the instrument panel below him." Casper said that he might accidentally bump a switch in his sleep, he found it better to sleep behind his helmet instead of sleeping inside his helmet during a nap.

At about 2½ hr into the flight, Casper said, he turned the three-year two-panel control light switch from "off" to "dim." As he did, the 0.9 kg light showed green as the automatic sequence. Whether Casper was flying in to the one indicator during the time the master panel switch was off or whether the current flowed when the panel switch was thrown to "dim" was not clear at first.

"I thought maybe at first I'd just ignore it," Casper said, "but I decided that maybe I'd better not." The 0.9 kg indicator, the three-panel light, was a vertical stack of 14 lights. It normally triggered by an accelerometer which sense the beginning of motion and commands the automatic stabilization control system (ASCS) to begin a constant 12 deg/sec stabilizing roll. The light is only an indicator and does not command any function.

The pilot said he turned off a few switches connected to that automatic re-

entry sequence and "then pretended to go back to try to figure out just what had happened" with the master panel overcurrent, staying light switch and a shot a timer for immediate reconnection.

After discarding with Maxonov control, it was determined that the automatic sequence overcurrent upstream of the 0.9kg panel could not be reset unless to issue the correct command to ASCS system for reset function. This reentry would have contaminated the Path 2 capsule to assume the proper attitude for landing as the final dual-priority retro-rocket and then the landing and jettisoning of the spent motor.

Using the fly-by-wire mode, Casper established the correct retro-attitude. But when, at 31 hr 29 min of flight, he powered up the ASCS electrical bus on its main 270-volt power source, which converts the direct current flow of the batteries into alternating current, he powered up normally. The first two ground-to-ground temperature checks, a 116-c° sensor used for the first reentry, and a second 199-volt switch which could be used as a standby for either bus, or rotated to the other bus, were both normal.

During flight, Casper said, he could see individual roads and even,

"I saw some little villages and I could, when houses were scattered out, I could see individual houses. I saw also, about that time, some trucks on the roads and not too long after that, a truck—with smoke coming out of it—going down a road." He also said he saw a boat on a river and the water it created.

Casper said he knew the light reading was erroneous, because he could see that the control switch to the master switch was "off." He then switched the volume reading on the main switch, which was "on," began to peg toward 150 v—a normal output at 115 v at 900 rpm—and to the best of his ability in the master sequence, he determined it would not start. "So (he thought) we would never come back without the cockpit," Casper said.

Of the two control modes available to Casper—fly-by-wire and manual proportional—the former operates directly via 4° pulses to the control solenoids on the thrusters and the latter through mechanical linkage to the thrusters.

Casper decided to bring both an stream simultaneously for two reasons—first, if the malfunctioning conversion caused a short circuit in the entire MAV electrical system during reentry when signals were high, he would still have enough power to control thrusters and, second, both systems operating together have higher thrust levels. 95, 12 and 2 lbs compared with 26, 6 and 1—with smaller thrust increments.

"I found," Casper said, "that reentry was easier through the first path than when we had been practicing on the second path." As he held reentry attitude, the spacecraft left as it wanted to start reentering. "It got a little wobbly on the controls, started moving, so trying to pitch up as the heat shell nose down for entry," Casper said. He started his entry roll out at that point.

"Very shortly thereafter," he said, "I noticed a lot of burning particles coming past and considerably heat on the outside of the heat shield, which was right next to the window. It passed out, got warmer and got hot, then when I had finally broken into several pieces and floated away, leaving."

He said he saw the fireball created by the high velocity spacecraft slamming into the dense atmosphere but that reentry particles were not disturbing. "I knew we had converted as to whether prolonged periods of weightlessness, whether somebody would be in real pain," the pilot said. "I don't feel that it is any different from what we have done on the orbiter."

Casper said that reentry on the French Gemini was "easier than anticipated." He had a smooth ride in a hot air balloon with a 100-c° sensor used for the first reentry, and a second 199-volt switch which could be used as a standby for either bus, or rotated to the other bus, was both normal.

During flight, Casper said, he could see individual roads and even,

"I saw some little villages and I could, when houses were scattered out, I could see individual houses. I saw also, about that time, some trucks on the roads and not too long after that, a truck—with smoke coming out of it—going down a road." He also said he saw a boat on a river and the water it created.

Casper said he knew the light reading was erroneous, because he could see that the control switch to the master switch was "off." He then switched the volume reading on the main switch, which was "on," began to peg toward 150 v—a normal output at 115 v at 900 rpm—and to the best of his ability in the master sequence, he determined it would not start. "So (he thought) we would never come back without the cockpit," Casper said.

## NATO Shaping Inter-allied Force With Air, Sea Nuclear Capability

By Donald E. Paul

Ottawa, Canada—North Atlantic Treaty Organization interallied nuclear force issues are being, in fact if not in name during the three-day NATO ministerial conference, have last week, increased liaison between the USAF Strategic Air Command and the centralized nuclear force arm also is expected to result from the meeting.

Creation of the interallied force was announced as a formally worded one-month ago, with the representatives of the 14 NATO members also at a general meeting to coordinate the regional defense's nuclear strike force. Using interallied strike groups which should be living.

The interallied force will be composed of three major parts:

- USAF's Polaris-firing submarine which presently are deployed in the Mediterranean area.

- Canadian Strategic Air Command strategic strike force of V-bombers present in RAF's Bruntingthorpe.

- Nuclear-capable fighter bombers squadrons of the other NATO air arms, including two French squadrons based in West Germany, which will be armed with US nuclear warheads.

The agreement also provides for cooperation in a nuclear target planning cell, which will be established by the USAF and the Canadian Air Force.

The planning cell will be headed by the commander of the Canadian Air Force, Lt. Gen. L. L. Lumsden, supreme Allied Commander in Europe.

Reconvened last week made to the council to include officers from other NATO nations on the liaison team in SMC headquarters in Ottawa, Ont., to begin the interallied target planning staff into closer coordination with the SMC group.

In a preliminary step to this, a group of NATO officers will be flown to SMC headquarters following the ministerial conference, for briefings on target planning.

Decision to shift control of the centralized force apparently was a political one, aimed at mollifying the French, who have opposed creation of the force on the grounds that it would present them from creating their independent nuclear force. Britain, on the other hand, while strongly in favor of centralized force, has been plagued by political infighting over the cost of the nuclear force.

The official entrepreneurship stated at

the close of the first day's session, however, said the potential conflict agreement is not yet in place.

Two other major points discussed during the first day's session included the need for achieving a better balance between nuclear and conventional forces in Europe and the progress being made in the creation of a NATO centralized nuclear strike force.

Both issues were tabled, with the nuclear-conventional force balance more thoroughly discussed by the second day's meeting of the general NATO council.

The centralized force would be composed of mixed national forces as SMC's nuclear strike force is already committed to Eastern European targets. The centralized force should be committed if an all-out attack was made on Western Europe. The US is according to some officials a leading proponent of the centralized force, particularly to convince its NATO allies that it is committed to a nuclear defense of Europe.

The nuclear strike force will be composed of three major parts:

- USAF Polaris-firing submarine which presently are deployed in the Mediterranean area.

- Canadian Strategic Air Command strategic strike force of V-bombers present in RAF's Bruntingthorpe.

- Nuclear-capable fighter bombers squadrons of the other NATO air arms, including two French squadrons based in West Germany, which will be armed with US nuclear warheads.

The planning cell will be headed by the commander of the Canadian Air Force, Lt. Gen. L. L. Lumsden, supreme Allied Commander in Europe.

Britain, on the other hand, while strongly in favor of centralized force, has been plagued by political infighting over the cost of the nuclear force.

The official entrepreneurship stated at the close of the first day's session, however, said the potential conflict agreement is not yet in place.

The US supported creation of such a force to integrate more fully NATO's nuclear force and at the same time to ensure that a greater portion of the burden of defending Europe would be assumed by allies. The US appears early to be on course to accomplish this in order to prevent a rift in the NATO alliance.

In his speech in the council, which had representatives from all 15 NATO nations, Secretary of State Gen. Dick Cheney said that it was the aim of the US to remove all doubts as to whether it was committed to a nuclear strike at will as a conventional warfare defense of Europe.

The US, according to Cheney, is to acquire more than 100 B-52 bombers, and the US is also a proponent of a general NATO nuclear strike force.

The centralized force would be composed of mixed national forces as SMC's nuclear strike force is already committed to Eastern European targets. The centralized force should be committed if an all-out attack was made on Western Europe. The US is according to some officials a leading proponent of the centralized force, particularly to convince its NATO allies that it is committed to a nuclear defense of Europe.

## Pan Am Considers Jet Commander

Pan American World Airways, still negotiating with de Havilland on the purchase of approximately 10 DH-125 aircraft for transatlantic freight transport, has started discussions with Air Transport Area Commander in the event of a breakdown in talks with de Havilland.

The discussions also provide for cooperation in a nuclear target planning cell, which will be established by the Canadian Air Force, which will coordinate target planning for the combined force. The planning cell will be headed by the commander of Gen. Louis L. Lumsden, supreme Allied Commander in Europe.

Reconvened last week made to the council to include officers from other NATO nations on the liaison team in SMC headquarters in Ottawa, Ont., to begin the interallied target planning staff into closer coordination with the SMC group.

In a preliminary step to this, a group of NATO officers will be flown to SMC headquarters following the ministerial conference, for briefings on target planning.

# USAF, Army Air Roles Evolving Slowly

By Larry Boede

Washington—Zigzag line of demarcation is being drawn, role-blend roles and mission by mission, to define the primary areas of aviation responsibility between the Air Force and Army. What both services had hoped would be a quick, clear action similar to the 1956 Kef West agreement has turned into a prolonged, competitive proof and test period (AW May 14, p. 26).

Both services have been agreeable, implementing recommendations made by two study boards last year, while Defense Secretary Robert S. McNamara and his advisers monitor the process and make decisions when necessary.

Neither the Army's Tactical Aviation Requirements Board, headed by Lt. Gen. Francis H. House, nor the Air Force Board, headed by Lt. Gen. Gabriel F. Domonos, proposed to review the House board's findings, but the Army was efficient, decisive, tactful, and more open to the recommendations.

A proposal by the House board was that planes must have a 100% for the Army environment. The only way to accomplish that, the board said, is for pilots to live and work with the Army in the field.

The Domonos group, on the other hand, planned that aircraft need not live with ground forces to accomplish them. The tactical commander and Army commanders need not live in the same tent, the board said.

The question was resolved when Gen. Walter C. Steiner, head of the Tactical Air Command, last year ordered all TAC officers and airmen in the field to west the Army's standard aircraft and the Army's aircraft standard. Army personnel now live and work with the Army in the field.

The question was resolved when Gen. Walter C. Steiner, head of the Tactical Air Command, last year ordered all TAC officers and airmen in the field to west the Army's standard aircraft and the Army's aircraft standard. Army personnel now live and work with the Army in the field.

On the other hand, Gen. Domonos said that the charter for the House board established a requirement to approve the capabilities of the Air Force. This was not done, he said.

## McNamara: Support

McNamara backed the Air Force on this point by saying in testimony before Congress that Gen. House "did not take full account of the extent to which the Air Force could support and perform some of the functions which the House board recommended. The Army provides some functions in particular, one, mobility, near battlefield mobility, and the movement of supplies into the battlefield, etc., and, clearly, we were not fully cognizant of those costs."

"I suspect that on both of those counts, we all had that the Air Force can give more support to the Army than the Army imagined or that the House board imagined," McNamara said.

The House board, in a sense, represents the aggressive attitude in aviation the Army has taken in recent years. The Domonos board represents a more

far 30,000 aircraft and 42,800 pilots.

The House board divided its analysis into three major areas: mission, personnel, and organization. In the mission division, a proposal for testing the concepts was denied, costs in dollars and personnel man-hours estimated a range of costs not prepared and manpower savings were presented.

Gen. House recommended that the Army provide its own aviation for special warfare missions aimed at training indigenous forces to combat insurgents' actions. The aircraft force would be assigned to a single aviation brigade assigned to the Army's wing, brigades assigned to the Army's wing, and others assigned to the Army's wing.

## Loudest Controversy

It was this particular recommendation that came with the Air Force's analysis in support of the House board's recommendations. The Air Force would be assigned to a single aviation brigade assigned to the Army's wing, brigades assigned to the Army's wing, and others assigned to the Army's wing.

The subordinate group would be assigned to the Army's wing, brigades assigned to the Army's wing, and others assigned to the Army's wing.

Under the proposed Army's wing

plan, the Army would grow to 10

regional divisions and 10 assault divisions. The number of each type of division would vary, but the total would remain at 16.

## Current Programs

The current Army aircraft program, now undergoing revision, calls for 4,857 aircraft in the inventory in fiscal 1967. The budgetary requirements for aircraft in the fiscal 1968 budget are estimated to be 4,874 for a total of 10,472, of which 1,180 would be transports.

The rest of the current fleet—51,662 aircraft—would be increased to a total of 53,784 aircraft by the end of 1970. The cost of these, about \$1,981 billion, would be absorbed by elimination of defense programs, a fourth of which some types of helicopters and some heavy aircraft.

Postional programs for the current fleet—6,930 aircraft, 2,208 warrant officers and 28,980 enlisted personnel—would jump to 9,300 officers, 10,380 warrant officers, and 71,800 enlisted men.

The expansion program would be given special congressional attention in the Army's future program. In addition, the Army would assume the role of defining the air force of tomorrow, when the strategic air force was being taken over.

Domonos and Steiner excepted to these points. Another air force would be created if the requirements were to be fulfilled, he said. The Air Force would grow from 459 in the present plan to 1,235 in the 1970s. The Army's 16 divisions would account

## USAF Compiling Space Projections

Air Force projections for operations in space are being compiled as a group of experts which will be submitted to Defense Secretary Robert S. McNamara in mid-June.

Analyses are being prepared by Space Systems Div. as a companion with Armstrong Systems Div., Air Force Special Weapons Center, Strategic Corp., and other USAF facilities. They constitute a response to a Defense Dept. request for USAF to supply data on systems in its study base military space systems.

Experts will encompass those of the related units which will be expanded to detail in Project Firefly (AW Apr. 15, p. 19) now being developed to clarify the Air Force's situation through the 1970 decade. The experts are expected to cover these operational areas:

• Mission and associated space vehicles. USAF probably will insist in this analysis the concept of a modified universal model as outlined in unclassified operations with maneuvering capability for rendezvous (AW, Apr. 5, p. 29).

• Interception, inspection and destruction of non-operatives, potentially hostile satellites. This project would incorporate most of the interceptors' concepts included in the declassified Project 216 (Shooter) satellite. These concepts have been considered for incorporation in a classified version of this satellite. This analysis also should consider the application of the modified universal model for this mission.

• Methods of protection for US satellites. This would be the reverse of the preceding category. It would accept the analysis of means for coping with potential inspection and destruction techniques which might be employed by hostile nations.

• Weapons and associated launch techniques from space deployment modules. This analysis would consider the feasibility of deploying weapons in relatively low altitude orbits, and would include related programming and targeting techniques.

• Mission planning development status. This study would be a review and estimate of a USAF concept proposed by DODD for a space vehicle to deorbit classified Air Force operating capabilities in space. USAF has not been successful in obtaining DODD approval to implement this type of program. The new analysis probably will examine feasibility of the USAF Boeing X-28 (Divine/Sord) space glider to conduct the assumed development status mission.

• Use of USAF Dyna-Soar and NASA/McDonnell Douglas concept for Air Force space stations. This will be an analysis of means of both these vehicles to utilize an unpiloted engine in space. Boeing has supplied data to USAF for this category.

Gen. Steiner pointed the Air Force board made clear that the new US satellite and space vehicles were not considered by the House board.

Gen. Domonos noted his study of roles and missions, command and control, air support, counter and interdiction, tactical reconnaissance and strategic assault.

Both boards recommended field testing McNamara in his last test site, the 304th Wing, involving initially \$70 million from Congress. This was later increased to \$100 million to \$150 million. McNamara said, "I don't fully believe we will have new roles and missions right now, and I think the Air Force is willing to consider the Air Force's problem. Now that we have increased the size of the Air Force, the airfield and the tactical fighter support, and now that the Air Force clearly understands the intent to which they believe our increments to their new roles of aircraft, which will not be able to reduce their strategic role. I am an airman who can't anticipate increasing support of the Army by the Air Force. I think that the issue, I don't

anticipate a roles and missions agreement."

There are the specific requirements outlined by the House board:

• Reconnaissance—Cessna OV-10A

• Attack helicopter—Bell UH-1B

• Attack plane—Convair AV-1

• Utility helicopter—Bell UH-1H

• Tactical transport—Bell UH-1D

• Command plane—Boeing C-130

• Utility plane—Hiller U-10A Courier

• Cargo helicopter—Vertol CH-47 Chinook

• Transport plane—Dc-10/11/13

• Boeing 747

• Boeing 707

• Observation helicopter—LORI

• Command and control—LORI

The board had recommended a number of aircraft to be used in other areas which would be used in support of the Army.

They are Douglas A-4 Skyhawk,

Grumman A-6 Intruder, Douglas A-4

Skylancer, McDonnell F-4B Phan-

tan 2, Lockheed F-104 Starfighter,

McDonnell RF-101 Voodoo, Fairchild C-119 Flying Boxcar, Lockheed C-141 Hercules, Lockheed C-130 and Douglas C-133 Cargomaster.

Armored units recommended by the board were two airborne grays and 610 rounds of ammunition for the Bell H-13 and Sikorsky H-21. Sikorsky helicopter units M-88 or XM-242 machine gun for the LORI, Vertol 21C, Sikorsky H-34 and Kaman HH-43B, four machine guns for the Bell UH-1A, two pods for 2.75 in. rockets or two XM-233 machine guns for the CH-47 Chinook, machine gun or M-16 carbine for the AV-1.

The Domonos board recommended that the Air Force be authorized 25 tactical air wings, the percentage of F-105s to be substantially increased, that a V-STOL fighter such as the Hawker P-1127 be developed, forced reconnaissance aircraft squadrons be increased from four to 10 squadrons, C-130 squadrons be increased to 12 and that a heavy cargo transport, the C-141, be developed at a later date in the Douglas C-141.

Gen. Domonos' board has since been increased, the C-130 has been upgraded in principle and the C-131 follows as a cost savings in proceeding. Gen. Domonos also emphasized a plan to fixate purified VTOL transports and 12, in 20 to 30 years gain battlefield. He said that the C-130 is much superior to the CV-22, having a 10 to 1 load factor advantage in its STOL version.

Over since the Army General Forum was given permission in 1964 to have their own organ, finance and administration, instead of assigning the tasks to the Army Air Forces, there has been controversy over the Air Force and logistic support for the ground forces.

After creation of a separate Air Force, the Army's ground forces would also attempt to support it. In the 1950s the Air Force was presented with massive modernization. This turned out appear not based on sound of nuclear weapons.

The 1959 Kef West Defense Conference set a limit of 5,000 lb weight on Army aircraft with emphasis to be granted only to the service of defense. These exceptions were granted in the case of mobile field and mobile heliocopters and M-100 and the C-130.

The change of administration in 1968 brought a policy change that emphasized less than about nuclear war and use of conventional weapons. The general situation is an outgrowth of the change of thinking.

The Army, now thinks that its area of operations is in the area which the rough fields are found and the aircraft—whatever sort it is necessary—to operate from them. It also wants its own procurement organization for aircraft and related equipment.

## Airlines Are Bystanders in Fare Dispute

**IATA efforts continue, but decision now rests with governments; U. S. attitude arouses Senate group.**

By L. L. Doty

**Washington**—International fare controversy has become a conflict between governments, with the airline industry forced to sit nervously on the sidelines waiting for a solution which it hopes will permit resumption of normal fare practices.

At the end of last week, the U. S. had made no progress in breaking the rate dispute that has left the U. S. airlines uncertain about what to charge and passengers confused over what a trip will cost. The British remained adamant in their position for higher fares (AW May 20, p. 39), while the Civil Aviation Authority Board favored for a compromise that would satisfy the British and mollify an angry Senate Commerce Committee.

The government at last has resolved to accept the compromise, but a request of the committee to have the rate cap removed from the nation and placed in the hands of politicians. The British position has been strong because of an enormous excess over the effort. British Overseas Airways Corp. defines as having on the British budget. The U. S. stand has been weak because of the State Dept.'s indifference toward air transportation.

An "informal" IATA conference of the International Air Traffic Council was to be held in Montreal late last week, after an earlier meeting in Brussels failed to arrive at a settlement. However, it is obvious that the airlines are in a bind. The U. S. has no power to make their influence felt in high governmental Irish share of traffic.

Resistance of the airlines to constraint themselves to a rigid stand is based not in the "position itself," taking during the Brussels traffic conference. Only 11 airlines adopted their world cap of 5% for increase on a world-wide basis. They were Air India, AirAsia, Al Al, Aegean, Canadian, Iberia, LANA, Middle East Airlines, Pan Am, South African Airways and United Arab Airlines.

It is noteworthy that airline groups emanating in lesser hemispheres—such as the Pan American and Pan Canadian carriers and Japan Air Lines—abstained from voting. Mexico also voted, but is known to have been considering voting along the Canadian line. Only LAN of Chile was willing to go on record in its stand against the fare board.

IATA traffic conference members have been mystified by the course dispute, but this is very likely a temporary situation. Peculiarly, that the IATA conference in Brussels offers has

imploded into a single staff meeting acceptable to more than 90 international airfares. This is work for a professional tariff expert and it is far to say that this networking is in the hands of someone when performed in a professional manner.

In addition, the IATA clearing house is an emeritus function of the organization and an economic committee, or the former Legislative committee of IATA could be divided to an executive committee and the group's annual general meeting, which would pitch both, and which CAB Vice Chairman Robert Murphy has termed IATA's "annual piano meeting."

State Dept. has often been accused of condescending to international airfares. It is no more important foreign policy coordination. However, airfares elevators were hopeful that the forthcoming renegotiation of the State Dept.'s station downer (AW May 6, p. 38), and the new international air policy (AW Apr. 29, p. 10) would strengthen U. S. dialogue with foreign nations on stationing in their countries.

However, the State Dept.'s negotiations at the Chaudhury fare train suggest that the U. S. position is that it is still David. One industry source told AW: "Now, **WEAK & SPACE TECHNOLOGY**, 'policy or no policy, it's still all game and no tyme.'

It is now apparent that the State Dept. is in action (AW May 20, p. 38), but undermined the Administration's new policy, leaving Congress to assert its share of strength in new possible. Meanwhile, under the administration's new policy, State Dept. will pursue international civil aviation more independently of allied nations. It has little to do with the rest of the airfield. Industry sources say that airline specialists who are assigned to State Dept. will be bypassed during the reorganization.

Last week, Sen. Warren C. Magnuson (D-Wash.) promised to take legislative steps that would give the U. S. more power in handling future international airfares. Although the legislation will give rate-making authority to the CAB—where most observers agree it belongs—the law is not yet. That is to bring an immediate solution to the present dilemma.

In addition, there is a strong disagreement between the airline industry and the Administration as to how broad the legislative authority should be. Stuart G. Tipton, president of the Air

Transport Assn. last week said the CAB should have power to suspend fares but should not have power from authority, as called for in a Senate bill proposed by Sen. Wayne Morse.

Today, the Senate Commerce Committee has voted to accept a package of international air transportation legislation based on the concept that the public interest is best served when international fares are established in the airlines with government approval and not by unilateral airfare "agreements." A second bill, comprising the CAB to stipulate rates in accordance with the ATA position was introduced in the Senate at D-Wash.'s request.

The bill proposed by the White House gives CAB the authority to regulate rates and practices of both U. S. and foreign air carriers in foreign air transportation, subject to the approval of the President. In sending the bill to Congress, President Kennedy said: "We should continue to prove that rates are not the only reasonable."

CAB holds that the bill is "an easier and more effective act to suspend or prevent a rate from going into effect," and insist that the Administration legislation is needed if the public interest is to be served properly. It is opposed by the administration. Boyd has stated that the public interest rule should not be applied to the current fare agreement because of the small amount involved in the rate increase. With respect to an evolution of the airfare law, Boyd said that

"...we don't believe we could uphold an antitrust action against our carriers when they are faced by a foreign government to apply a certain rate."

Prior to the London conference, the Chaudhury fare train was told Boyd submitted that other international could submit the Chaudhury fare and "in no way affect the fare board." But, he added, if this did happen, he would like legislators that would give the U. S. broader rate regulation power. He noted then that the U. S. government could make U. S. carriers drop out of IATA. In an event he said, "it is far to me that we will take a greater interest in IATA in the future."

Last week, Sen. Magnuson, another Democrat, presented quick action in pushing through legislation to give the CAB more control over international airfares, although there was no indication which bill would be introduced. He said: "I want the bill and it will be a good one."

Stark and an aluminum SST-like iron ore fare board growth is problematic and range and range and each aluminum and stainless steel manufacturers would allow for increases in range and speed. At this point, Roman Blythfield, director of advanced research and technology at the National Aeronautics and Space Administration, went into play. "Stainless steel caught a sympathetic to the development of a high, efficient supersonic transport (HST) because of temperature environment of the upper air," he reported, "and the aircraft's structural and fatigue resistance."

He said that the FAA era and those years are early on the industry with no indication whether the industry

## Flight Forum Participants Believe U.S. Will Develop Mach 2 SST

**Buried**, **Cross**—Believing that the U. S. will decide to develop a Mach 2 supersonic transport was widespread during the Government Civilian Leadership Flight Forum. This view is one of several points first noted during a day of Mach 2 debate to be conducted.

Federal Aviation Agency Administrator N. E. Hahn has presented his recommendation on the project in a report to President Lyndon Johnson (AW May 6, p. 38). In addressing the various points, Hahn also said that the government should play a stronger role in the development of the supersonic transport.

In his report, Hahn called for the development of a "fly-by" or "satellite," which the U. S. could be available within 10 years if sufficient effort is put into the project. The satellite will be a VSTOL, which, powered with 14 engines having a 100 ft. lift in a weight ratio, when it is boosted will be available within 10 years.

However, the president's opinion was that the government has decided not to try to impose with the same technical problems that a Mach 2 aircraft would present in development.

Against this, Hahn officials argue that the place of a nation's future is a major factor and, therefore, the three aircraft seems the second sponsored by Lockheed Corp. The supersonic transport emerged as the principal theme in a panel discussion, with those officials calling for caution in approaching the project and aeronautical engineers suggesting acceleration of the supersonic project and exploration of a hypersonic transport aircraft.

Most vocal proponent of the Mach 2 or higher speed transports was John Stark, vice president and director of engineering for American Aviation Corp. He called a Mach 2 project "bargain" and said he would like to form a team in Virginia to the U. S. administration develop a Mach 2 aircraft.

Mr. Hahn, however, was not so "disengaged" and "disengaged" and told the group that a Mach 2 aircraft "won't be built and it will be built."

Stark and an aluminum SST-like iron ore fare board growth is problematic and range and range and each aluminum and stainless steel manufacturers would allow for increases in range and speed. At this point, Roman Blythfield, director of advanced research and technology at the National Aeronautics and Space Administration, went into play. "Stainless steel caught a sympathetic to the development of a high, efficient supersonic transport (HST) because of temperature environment of the upper air," he reported, "and the aircraft's structural and fatigue resistance."

He said that the FAA era and those years are early on the industry with no indication whether the industry

is interested in the project. "It is the FAA that makes economic forecasts."

# Building Owners Fight Rooftop Heliport

By James R. Ashlock

New York First organized opposition to the proposed helicopter operation from atop the new Pan Am Building as midtown New York came last week from owners of other skyscrapers near the structure.

Sources close to the case interpreted the attack as an indication of the controversy expected when city approval is sought for New York Airways to begin scheduled operations from the heliport.

Spokesmen say it now appears that use of the heliport may be delayed much longer than earlier anticipated, considering that all opposition must be heard and approval gained from city and city agencies.

Signers of the protest are Samuel D. Leibeskind, former S. Gershom and Sel Goldstein, all presidents of corporations owning buildings close to the Pan Am structure. Goldstein heads the organization that owns the Chrysler Building.

"We believe that this rooftop heliport in the densely populated Grand Central area would present many dangers to the public and that the noise from the heliport operations would be

## Precission VOR

Deutsche-Federal Aviation Agency is developing a new precision VOR station that it expects to add at much as a fivefold improvement in accuracy over present facilities.

Details of the new development, announced for use in the 1970s in either of several, as part of FAA's new VOR navigation system, were disclosed by Alexander B. Walsh, of the agency's extreme design staff during the recent National Aerospace Electronics Conference here.

The new type VOR will be fully compatible with existing airborne equipment and provide increased accuracy to create locations in the flight network to make approach to an airport accurate to an mile, equipped with a small antenna, Walsh said. Present tests by Deutsche Luftwaffe laboratories using modified airborne receivers show overall error ground-to-airborne equipment of about 1 deg, but Walsh expects that 1.31 deg will be a more realistic operational figure.

Concept for the compatible precision VOR is credited to FAA engineers who devised the idea of modifying the newer Doppler VOR, which FAA says at the first using horizontal to provide the more accurate service. The 12-degree azimuth error of the Doppler VOR is modified to 1.31 degrees, 15 times more accurate as a reference displayed 7 kilometers from the center frequency as presently used spectrum between the VOR wave channel and Doppler reference.

Concept for the compatible precision VOR is credited to FAA engineers who devised the idea of modifying the newer Doppler VOR, which FAA says at the first using horizontal to provide the more accurate service. The 12-degree azimuth error of the Doppler VOR is modified to 1.31 degrees, 15 times more accurate as a reference displayed 7 kilometers from the center frequency as presently used spectrum between the VOR wave channel and Doppler reference.

Map, including two fixed landings in New York harbor. They suggested that, for safety reasons, the heliport could be located on an East River pier near the United Nations, several blocks from the Pan Am Building.

They acknowledged the potential advantage of a rooftop operation but said this was not sufficient justification in view of the noise and safety questions.

The aviation industry has much patience in the safety and comfort of the public and there does appear to be any adequate benefit to compensate for the dangers and inconveniences that the project presents," they said.

Following the protest, the FAA approved of the rooftop operation landing permits on a demonstration basis, but the agency is awaiting a ruling from New York Airways to submit a pilot training program for flights off the roof. FAA would separate the actual flights and has its approval or disapproval on its discretion.

FAA officials have already participated in three helicopter flights in look over the lighting for night operations at the heliport. Lights illuminate not only the landing area but the sides of the building immediately below the pad. The FAA spokesman said the lighting arrangement appears to be very good.

However, it within the city agency, that the greatest delay in the heliport's operation is expected to be its construction. Spokesmen say some months could pass before all the required publications are carried out.

Even after the City Planning Commission holds public hearings and approves or disapproves the permitting, its recommendation can be subjected to other agencies such as the Traffic Dept. and the Board of Estimate.

Also involved is the Dept. of Revenue and Assessors, which is responsible primarily for judging the heliport's safety and financial cost.

However, he emphasized that the application for the zoning change must be filed and approved before the heliport operation can begin. The fact that such applications has not yet been filed at the time no public hearings are to take have been acknowledged, he said.

Grand Central Building's owner must be the first to submit application, even if it is submitted by the lesser Pan American World Airways. A memo from the General Control Building said it had not been determined yet when the application would be filed.

Everyone can not assume that the proper procedures will be followed," he said.

Complaints also resounded the government agencies of New York Airways

factor. The Port of New York Authority is not involved, since the heliport is located on private property.

Spokesmen say also that because of the new considerations posed by a side river heliport, there is a question of whether city agencies would have approval.

Pan Am and New York Airways acknowledged the question when they sought approval for a helicopter landing on the roof to dissipate the building's dedication on May 7.

"Everyone in the city was very wise and arrived in favor the idea but we just couldn't determine at time what the approval had to come from," a spokesman said.

Even test flights, which New York Airways must conduct for FAA approval, may be delayed for a long time.

The question is, do test flights constitute establishment of the port as a heliport," a Dept. of Marine and Aviation spokesman said. "Somebody will have to decide, I don't know."

New York Airways bases its qualification to operate from the roof primarily on having Boeing Vertol 107 aircraft with twin turbine powerplants. The V-107 is capable of vertical flight and is certified as being able to fly with one engine inoperative.

The airline is planning to equip its V-107s with a helicopter version of the General Electric CT58-11B engine, which would increase the shaft horsepower per engine from 1,210 shp to 1,390 shp. The 200 shp increase per aircraft would substantially improve the vertical flight performance, New York Airways officials said.

New York Airways has also ordered two more V-107s, which will bring its fleet total to 10 (AVM Model 11-10). A third V-107, already on order, is expected to become part of the newly ordered aircraft scheduled for delivery in about 14 months.

Robert L. Cummings, president of the airline, would not disclose details of the financing to cover the cost of more than \$2 million for the three new aircraft and spare parts. The financing program will also include \$1 million in working capital which New York Airways needs as a result of its need to subscribe up to \$100,000. Pan Am is 123 ft. long, 33 ft. 6 in. wide and 50 ft. above the street.

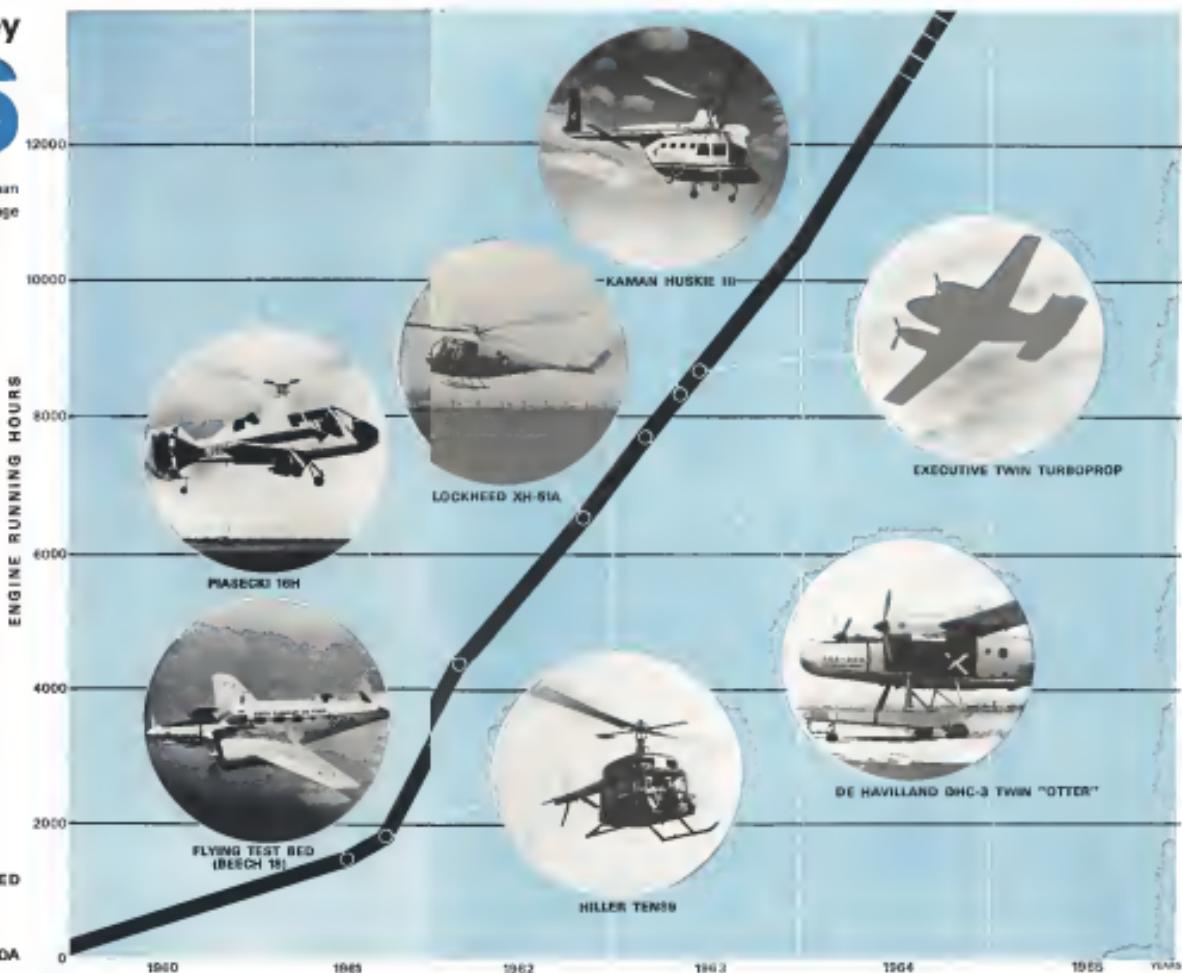

**HELIPORT'S PROXIMITY** to other skyscrapers, including the United Nations Building and the Chrysler Building (top) is evident, although distances between major structures appear shorter. Dotted line (below) is approximate limit for safety maneuver from the heliport to vertical, horizontal and diagonal lines above the building. The vertical control tower (Dotted line) is the building's communications tower. Indicators have legends of a commercial type to show that wind and noise level could interfere air flow within 15 ft. of the surface at velocities up to 100 mph. Pan Am is 123 ft. long, 33 ft. 6 in. wide and 50 ft. above the street.

## THINK DESK-SIZED COMPUTER

Why buy a giant-sized electronic computer? Why pay for computing capability that's far beyond your need—and your budget? A desk-sized, general-purpose digital unit from General Precision may meet your requirements nicely—and save you money, too. General Precision computers are performance-tested and value-priced in hundreds of applications. They're solving tough problems in engineering departments, scientific laboratories, academic institutions, and varied business enterprises across the nation. Call, write, or wire today to learn which computer best fits your operation and your budget. Each purchase price and leasing plan includes use of an extensive program library covering metal analysis, input-output flexibility, plug-in convenient standard output. **LGP-38® General-Purpose Computer**

Fast—and most widely used—desk-sized, general-purpose digital computer. Performance-tested in scores of applications. An ideal student training aid. **RPC-4860 Electronic Computing System** Versatile system consisting of completely transistorized RPC-4810 eight-bit computer and RPC-4800 tape-type-writer system. Magnetic drum memory, 3808 words. Can solve problems in engineering design, data reduction, statistical analysis, and advanced systems design.

Ground support equipment for the Douglas DC-9 is modular. The same as that required for L-1011 required for L-1011. Aircraft is designed for 10 min. time of refueling stops—20 min. when refueling is interrupted. 30 min. turnaround of major ferocious points. 30 min. light engine at stops no extra shutdowns used for ground power. Optional auxiliary power unit adds 540 lb. to weight-critical nose unit.

## DC-9 Design, Performance Projections Shown

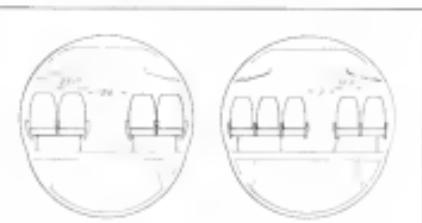

Increased performance and payload is evident in figures quoted above from original DC-9 estimates (AVW, Jan. 22, p. 48). Increases are largely result of airframe redesign for more reliability. Large range version would copy construction tool.

Three seating configurations for the DC-9 are offered. Most sources considering the aircraft recommend from 20 passengers single class to 65 passengers mixed-class arrangement. Note special area for carry-on luggage in middle doorway; single-class layout allows passage at front and rear. Aircraft is designed for two pilots, but has space for flight engineer.

Different engine than the one originally proposed will be used on the Douglas DC-9 in a result of new studies that give the current version about 13,000 lb. gross weight compared with 9,400 lb. in the initial plan. Pratt & Whitney's JT8D-10 propellants will provide 12,000 lb. of thrust at 20,000 ft. higher than the P.W. JT8D-1 (first planned). Aircraft has been designed toward minimum landing weight limitation to facilitate development of thin aircraft without impact of refueling. On short-range DC-9 version (3W, Apr. 15, p. 11) maximum landing weight is 73,000 lb. compared with maximum takeoff weight of 77,600 lb. Single-engine does not have a self contained system; eliminating need for possible stops at all 12,000 ft. Stop-distance is also considerably simpler. Four three-in-longer pits. This configuration has as profile, and offers 505 cu. ft. in the forward wet and 311 cu. ft. in the aft.

Proposed seating would provide 15.9 in. between centers of row seats on front and rear seats. Douglas has recommended a seat design for the aircraft, but will submit final seat consideration.

# AER LINGUS IRISH INTERNATIONAL chooses BAC ONE-ELEVEN

Mr. J. F. Dempsey, General Manager of Aer Lingus says:

"Aer Lingus has chosen the BAC One-Eleven as the aircraft most suited to our requirements for a fast, economical and comfortable jet transport over our European routes."

The One-Eleven is in our opinion the most advanced short haul jet. On inter-city routes it will offer performance and passenger comfort equal to 'big jet' standards.

Provision for future all weather blind landing aids is built into the design of the One-Eleven and this was an important factor in our evaluation.

We believe that in its particular field the One-Eleven represents a marked improvement on all other available equipment and we are satisfied that the maker's claims in this respect are well founded."

## Instability Absent in Recent F-1 Engine

By C. M. Hoffman

**Los Angeles**—Combustion instability problems experienced in development of Rockードne F-1 1.5-million-lb thrust, liquid-oxygen rocket engine continue to pose the most serious obstacle in preparing a for preliminary flight rating test (PFBT) late this year.

First F-1 production engine is scheduled for delivery to National Aeronautics and Space Administration's Marshall Space Flight Center in October. Qualification and first flight are scheduled in 1968. NASA has insisted that engine be certified as stable for human occupancy as much as possible prior to the PFBT.

Channeled as a group of five, the F-1 engines will power the first stage of the Saturn 5 launch vehicle for the Apollo-manned spaceflights.

Extensive research and engineering efforts by NASA and Rockードne on the combustion instability, also called combustion oscillations, are reported to be paying off. Both frequency of occurrence and an order of the instability have been reduced in a recent series of tests, according to Rockードne.

In the latest test series of seven, 40 full-thrust, varying duration engine tests over a modified engine, no evidence of combustion instability has been found. This test series, as well as a better understanding of F-1 combustion through related research, has produced optimism at NASA and Rockードne that the problems can be resolved, al-

though both organizations admit that combustion instability may still be present.

Top-level NASA decision is expected this summer on starting F-1 production with the latest instabilities modification to cover the scheduled October delivery. The decision will involve determining whether limited testing on the latest modification, if no instability problems arise, is a sufficient fine line for beginning production.

Combustion instability has occurred in eight of more than 310 tests of the F-1. Seven occurrences in 250 tests were reported by S. K. Hoffman, Rocketdyne's manager of the engine's space flight laboratories, at the recent Space and Astronautics Contractors' May 16 dinner meeting on the problem.

Hoffman also said at the meeting that starting combustion in a recent test was 99%. Overall starting reliability figures at approximately 95%, with shutdown reliability closely approaching or surpassing that figure.

Opinions have varied on the relative importance of F-1 instability as the cost part of the development program, which now is roughly at its midpoint.

Rockードne feels the problem has been more severe than in other engines it has developed, including Atlas and Titan missile engines, which enter combustion instability relatively smoothly.

Rockードne's original approach to handling the F-1 assigned to NASA, was that the engine be modified before the first planned flight. Since after the start of full-thrust engine tests at the

Edwards AFB, Calif., high-thrust test site only last January, however, NASA became concerned with the instability problem. Two teams of NASA propagation specialists were formed (JANW Feb. 4, p. 25) in mid-February of 1962 to help resolve the problem. Both teams are still active.

NASA's insistence on increasing combustion instability has resulted in higher instability requirements at each stage of development than ever before cited for a new engine. To meet these demands, Rockードne is devoting roughly one-third of its total F-1 engineering effort to the consideration of combustion instability. Approximately 175 engineers and managers from within the company are assigned to the job, working primarily on analysis and design.

Difficulties in coping with the instability problem stem mainly from the lack of basic knowledge of the phenomenon and the problem of extrapolating smaller engine technology to a large engine like the F-1.

The solution to the instability problem in the past generally has entailed modification and testing. Frequently, the engine was modified and then tested to verify the fix. If the engine worked successfully, it was fixed. If not, other modifications were evolved. Shape and size of the thrust chamber have also been varied to allow plenum instability, although this change, the general geometry of F-1 chamber, has been ruled out.

Rockードne is now conducting full-thrust tests at those test sites on the Atlas

(p. 46, right) as wind splits LOX cloud. Engine is out at full thrust (about) creating water vapor cloud from flame deflector cooling system

## Test Series

engine, to reduce tangential instability. A shock wave propagated around the perimeter of the thrust chamber. The wave front is caused by a local disturbance, sometimes a variation in burning rate. Shocks break up the wave front as it attempts to follow the periphery of the chamber around its point of origin, or alternating waveform.

Without the baffles, if the shock wave arrived at the right time, it would be boosted rather than attenuated by the local explosive burning of fuel and oxidizer which had accumulated during the time it was traveling around the edge of the thrust chamber. This would result in a continuous cycle of successive, self-amplifying pressure oscillations within the chamber.

Shock wave also acts as a diffusing mechanism, providing better mixing of fuel and oxidizer, with attendant high heating temperatures. Hot spots are formed when the shock wave penetrates through the cooler, outer boundary layer and contacts the chamber wall. If the engine is not shut down, complete burning through small areas.

Other basic forms of combustion instability, resonance-oscillation lock and lock along the radial axis and longitudinal-parallel to the thrust axis—have been experienced at different times with different F-1 engines. Transient modifications have been made on frequently in F-1 development, and research is being conducted on other heat-gain suppression to alleviate that problem.

Modifications of the injector have been

F-1 ENGINE is shown on two-engine test stand at NASA's High Thrust Test Area

## Fiber glass propellers for U.S. Military VTOL research plane

The X-22A Navy Research Vehicle, built by Textron's Bell Aerocar, will be a dual-tandem, ducted-propeller, VTOL aircraft. It will be designed to carry a two-man crew and six passengers or a 1,800-pound cargo at speeds up to 350 mph.

The unusually light, tough propellers required by the X-22A will be developed by Hamilton Standard. Each propeller has an integrated gear box and ultralight blades constructed of fiber glass with a central steel spar. This advanced design will make possible considerable weight savings. Hamilton Standard is also building lightweight propellers for the XC-142A, the Tri-Service V/STOL transport under development by Chance Vought with Miles Aircraft and Ryan Aerocar.

Each X-22A will have four ducted propellers, arranged in dual tandem. The ducts increase propeller thrust during vertical takeoff and landing, and supplement wing lift during forward flight. Four General Electric T-58 engines will power the propellers through an intermediate shaft system.

These propellers are only part of a comprehensive development program under way at Hamilton Standard for new lightweight VTOL and STOL propeller systems. This work is a natural outgrowth of more than 40 years of designing and producing propellers for the aircraft industry.

## Hamilton Standard

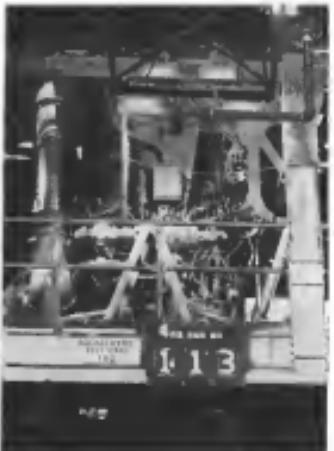

DIVISION OF UNITED AIRLINES CORPORATION

INNOVATION. INTEGRITY. INTEGRATION.

CLOSE UPS OF X-22 engine show vented pipe (left) which ducts exhaust from gas turbine and directs it into nozzle of exit nozzle for boundary layer cooling. Test manifold (right) consists of upper horizontal liquid oxygen line and lower hydrogen line.

The basic approach to solving the F1 combustion problem is to shorten the distance between the injector nozzles, which have been described as a flat plate with about 6,000 metering holes in groups of three to form a single liquid oxygen line and a group of two to form a single hydrogen line. The size and location of the metering holes have been varied in an effort to obtain stable combustion.

Injection nozzles are fabricated by Rocketdyne to produce intermixing dimensions, or preheat, between the two combustion air injections. Four fuel nozzles, hand-made since no production line is available. By following the procedure, Rocketdyne feels once a final design is decided on, the problem of instability is near likely to show up in production ingots.

Some combustion instability occurs at random, Rocketdyne has induced combustion ignition in all F1 thrust chamber tests for the last four months by using the "bomber" technique. This method was successfully in previous engine development programs helps produce stability, but for observation it also indicates whether an engine is inherently stable—use requirement for minimum flight.

Technique involves detonating a charge of powder inside the thrust chamber to induce an artificial shock wave

During F1 thrust chamber tests, the shutdown sequence is started at some time. A liquid delay is used so that ignition allows sufficient time for the mixture to move and prevents engine chamber damage.

Pulsed charges varying from 13 to 200 grams have been used to date in tests but the use of charge and the point when it is detonated apparently have little effect on the engine's ability to withstand the explosion, according to Rocketdyne.

It is difficult to understand, Dr. Tschudig, generally, why designers are not hot on using mixtures of base depending on engine configuration. Some configurations have however, incrementally worse, indicating an unstable configuration. These cases, however, represent a relatively small part of the total tests, Rocketdyne says.

No base tests have been made on chambers fitted with the recently modified fuel injector location of previous shielding configurations.

Rocketdyne is preparing to run a break test on a complete engine to see if the thrust chamber tests duplicate the results obtained with a test firing of the nozzle.

Other technical efforts being employed at Rocketdyne, to study nozzle flow, is an extensive series of nozzle at

past tests and an extensive instrumentation on current tests. High-speed cameras, capable of 5,000 to 5,000 frames per second, also are being used to record the combustion process through windows in the thrust chamber wall.

Overall reliability established by the F1 in the development program to date is approximately 70-75%, according to Rocketdyne.

This figure includes consideration of all scheduled items associated with the engine, including combustion stability, components requalification and engine performance.

The element of prime importance for the F1 is, as well as engine operation, is protecting substructures, according to Rocketdyne.

Thus, new stands for testing production engines are being constructed at the Edwards Air Force Base test area, and work should be completed in May 1964. Cost of the new stand project is estimated at \$10 million.

Construction of the first stand will be completed by November, and the stand should be operational in January 1964. The last of the three stands will be completed in the experimental test version. These test stands are as yet at the Edwards Flight Test Center for engine testing and one for thrust chamber testing.

## A thud, a thump, a squeak. And he's home.

There is no such thing as a soft landing in service. It's this. The landing gear must be able to take it. We see to it that it can.

Bendix<sup>®</sup> struts for both carrier-based and land-based aircraft are designed to meet the most rigid specifications for durability, reliability, and economy. We currently supply struts for several operational re-

covery planes, and wheels and brakes for several more.

Every day, Bendix equipment demonstrates the high strength, light weight and superior performance which we build into it. Let us show you just what Bendix struts, wheels and brakes can do to solve your problem. Write to us in one of Ahlstrom Equipment Sales Manager, South Bend, Indiana. We currently supply struts for several operational re-

# Lunar Landing Abort Techniques Studied

By Erwin J. Bollan

Dallas—Procedures and equipment designs that would be required by Lunar Excursion Module (LEM) crews to abort at short ranges when the vehicles are separated from the command module are being studied here by National Aeronautics and Space Administration researchers in Long-Term Vehicle's moving-base simulator.

Studying programs that far has amazed the LEM's primary guidance system has failed during the vehicle descent to the lunar surface and that the astronauts will be required to use manual control to abort the landing, intercept and return the lunar orbiter command module back to earth.

Under a \$100,000 contract from NASA's Manned Spacecraft Center, Houston, Tex., the astronauts have been using the free-fall simulator (AWW Jan 15, 1962, p. 77) to evaluate various approaches to developing and agreeing the command module.

### Abort Conditions

Put into such relative positions of the LEM and command module at the time of abort, the reentry nose angle required and the LEM's final orientation are being considered.

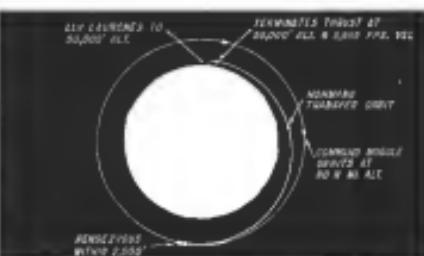

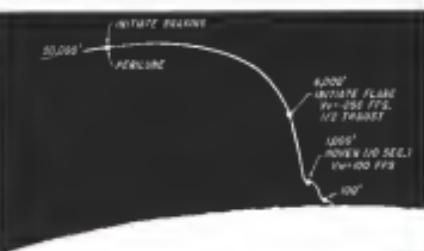

The standard situation involves early separation of the LEM from its landing platform prior to touchdown on the lunar surface. Some simulations also have been made of separation immediately after touchdown and at various time intervals after touchdown.

From astronauts considered, there seems no doubt that an astronaut can manually accomplish the landing abort launch and intercept mission in event of LEM primary guidance system failure according to A. D. Schlesinger, LTV Astronautics. The project engineer on the study, NASA project engineer is D. C. Chastain of MSC's Spaceflight Technology Division.

### Astronaut Participants

Astronauts who have participated in the studies thus far include: M. Scott Carpenter, Walter M. Schirra Jr., and astronaut-cosmonauts Neil A. Armstrong, James A. McDivitt, Elliott M. See Jr., Charles Conrad, Jr., John W. Young and Edward H. White, II.

These studies follow numerous similar studies made by LTV on its simulator. A typical abort landing vehicle maneuver, entering trajectory and gain and control inputs generated by LTV personnel is based on a constant and stable reentry orbit of 80 miles at 10° altitude as a programmed descent of the LEM to

EQUAL-PERIOD ORBIT TECHNIQUE, top, could be used by lunar landing vehicle (LLV) to make approach to landing site. LLV descent is shown in center photo. Bottom is launch of the lunar orbiter at 80 miles at 10° altitude as a programmed descent of the LLV to

Bendix Products Aerospace Division

**ASTROHUT WALTER M. SCHIRRA, JR.** studies an LTV simulation's information display prior to simulated Louis Ebernon Model 7000 practice flight.

the surface. The orbit of the moon is made by the command module to set up the reentry point for the lunar lander as the following orbit to permit an optimum descent orbit for the lander vehicle.

The orbital reentry of the LTV from the command module at the three-quarter point using transbrake jets.

The crew, in simulated flight, entered the landing vehicle so they were laid down and faces forward. Reactor boosters were then fired to obtain a 372 fpm delta velocity. The vehicle was boosted downward and 2.5 deg noseup, passing some of the final forward velocity while changing the LEO's orbit.

The reentry orbit technique is designed so that the landing vehicle is an orbit with a periselene of approximately 50,000 ft above the landing point and an apogee of approximately 500 nautical miles.

Should the main descent engine fail to ignite for the final landing phase, the lunar lander would then coast to ward reentry of the command module's orbit.

#### Landing Sequence

Approaching periselene, the aerobat crew again reentered the lander so that the lander was horizontal, with the main landing separated and upward. The reentry was firm at the point of periselene, which is approximately 170 nautical miles from the final touchdown point.

The vehicle then was tilted counter-clockwise so that the thrust vector was

positioned along the descent trajectory. Periselene would be estimated about 1,000 ft above the lunar surface and most of the landing site would have a relatively smooth and the vehicle is maneuvered to a smooth touchdown.

Flight from periselene to touchdown as practiced in the aerobat, consumed approximately 54 sec.

#### Lunar Takeoff

Scramjet takeoff and return to the orbiting command module was begun when the command module was some 170 nautical miles from the lunar lander. Flight path followed an altitude and velocity schedule designed to accelerate the lander lander to greater speed at approximately 500 fpm.

After takeoff, the aerobat maintained a constant velocity of 372 fpm, keeping the thrust vector aligned with the velocity vector. By the time the vehicle reached simulated apogee speed—5,553 fpm—the thrust vector was aligned horizontally.

At 50 nautical miles from the landing site, the aerobat speeded up to 1,000 fpm—the aerobat tilted the thrust vector slightly downward to maintain a constant altitude.

Upon passing apogee speed and at timing, Hohmann transfer speed, a rapid reentry began lasting about 14 sec., thrust was terminated and the lander landed on the aerobat's floor for reentry to reenter the orbit of the command module.

At the time, the lander attained Hohmann transfer speed, it was some 200 nautical miles from the final touchdown point.

## AFOSR Awards

At its Office of Scientific Research recently awarded grants and contracts totaling approximately \$2 million to universities and research firms in the United States and Europe.

### Grants

**University of Illinois, Urbana, Ill.**—\$100,000 for study of problems related to control systems.

**University of Michigan, Ann Arbor, Mich.**—\$100,000 for investigation of the effect of temperature and mechanical stresses on electronic components.

**University of Minnesota, Minneapolis, Minn.**—\$100,000 for study of the effect of temperature on the mechanical properties of materials—copper, copper alloys and pressure-treated materials used in aircraft structures.

**University of Michigan, Ann Arbor, Mich.**—\$100,000 for study of the effect of temperature on the mechanical properties of materials used in aircraft structures.

**University of Michigan, Ann Arbor, Mich.**—\$100,000 for study of the effect of temperature on the mechanical properties of materials used in aircraft structures.

**OUR POINT IS...**  
we make self-luminous parts glow up to 5 times longer!

And besides longer life, we have self-luminous parts a brighter glow, make them safer, too! Request our 3M Self-Luminous Materials catalog for starting isotopes instead of the traditional radium. Beta energy sources produce a brighter glow than our radium. And the glow is longer lived—up to 5 times—because there's no alpha emission to deplete the phosphor.

Why safer than radium? There are no penetrating gamma rays. No toxic radon gas emission. And two of the isotopes we've used in 3M Materials—Pb-210 and Sr-90—are easily in chemically inert, phosphors, among 3M Brand Radiating Microspheres. But if you'd prefer these were spheres that do not biologically react with the body, just pass through intact. Other isotopes activated offered are Tritium and

Curium.

3M Nuclear provides self-luminous materials in a range of colors. We'll provide the entire finished part, apply the self-luminous material for you to screen, truth or

# How Goodyear "Engineered Value" solves tough flight problems

## FOR LIGHT PLANES

**PROBLEM:** Better, lower-cost braking.  
**SOLUTION:** "Ring Disc" wheels and brakes.

"Engineered Value" Advantages: Longer lining life. Prevent tire damage without necessity of brake removal. Lower brake pedal loads. Better brake fade. Structurally fail-safe. Provisional wear indication.

## FOR AIRLINES

**PROBLEM:** Short jet tire life.  
**SOLUTION:** "Red Streak" Jet Tire.

"Engineered Value" Advantages: Up to 15% more landings per tire. More rubber at wearing surface. Braided wire shield resists cuts and cut growth. Has built-in wear indicator. Allows more retreads.

## FOR THE NAVY

**PROBLEM:** Helicopter rotor deicing.  
**SOLUTION:** Iceguard.

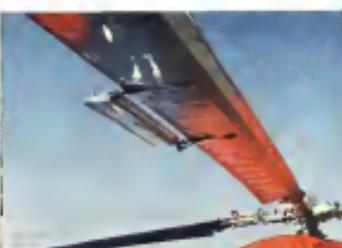

"Engineered Value" Advantages: Most efficient type of ice removal. Provides uniform heat; no hot spots, no cold spots. Has no effect on airfoil surface or balance. Has no moving parts. Lightest weight.

## FOR THE AIR FORCE

**PROBLEM:** Heat-shield missiles.  
**SOLUTION:** Goodyear Thermal Shield.

"Engineered Value" Advantages: Withstands 6,000-7,000°F-shielding environments for 50-90 seconds. Takes gas speeds on surfaces up to Mach 5. Below 5,000°-tan press and missile liner molding requirement.

"Engineered Value" is a Goodyear exclusive. It means extra value in products developed through the unmatched capabilities of one of the world's largest, most experienced manufacturers of aircraft components—Goodyear. Since Kitty Hawk, Goodyear scientists, engineers and researchers have been solving flight problems with "engineered value" products. They stand ready to solve your problems, too. For full information write Goodyear, Aviation Products, Dept. E-1710, Akron 16, Ohio.

Important: All trademarks and service marks are the property of Goodyear Tire & Rubber Company.

LEACH HERITAGE OF THE AIR—28

## THE DANGEROUS BABY

The Summer of 1915 was tough as the Tommies dug in along the Belgian front near Ypres. The Germans were pummeling the British trenches with deadly accurate shell fire. And the enemy artillery batteries were well-hidden.

To find something for the British to shoot at, a call went out to the Royal Flying Corps for aerial scouting.

One of the favorites of the R.F.C. was the Bristol Scout. Even by 1915 standards, the plane was tiny. Sometimes called the Bristol Baby Biplane, it was a mere eight and a half feet long, 20.4 feet from wing to wing, with a wing span of only 21.7 feet.

But the Bristol Scout, powered by an 80-hp. Clerget or Le Rhône rotary engine, could outmaneuver anything the Germans had at that time. Fully loaded, it weighed a little over a thousand pounds and could climb at the rate of 600 feet a minute and reach 10,000 feet in 97.6 seconds.

Because the 1916 airframe was used as a spy in the sky, there was no provision for armament. While most German reconnaissance planes carried a machine gun, the Bristol Scout was only occasionally fitted with a Lee-Enfield rifle, minus the stock, attached to the right side of the fuselage.

The observer in a German plane could see his machine gun and fire in almost any direction. The pilot of a Bristol Scout could fire his rifle only 30 degrees to the side and down from the line of flight—and without a sight.

The only other armament was a Mauser pistol in the cockpit and five grenades carried in a pack fixed to the right side of the fuselage.

The Bristol Scout also had the distinction of being the first land plane to take off from an aerial carrier. On November 5, 1915, it needed only 36 feet to take off. But the plane couldn't land on the carrier. It had to be fitted with skids to let it stand after climbing.

Utilizing second Summer of World War I, Bristol Scout and their German counterparts safely passed under 100,000 reconnaissance missions. Unfortunately, a pilot or observer of one plane would pop off at another with a rifle, pistol or shotgun. But it wasn't until someone realized that these aerial audacious posed a real threat, that armament began to appear.

One of these sources was Captain Louis G. Hocken, twenty-four-year-old pilot of a Bristol Scout attached to Newhaven & 6 Squadron of the Royal Flying Corps in Abbeville, Belgium. Already the holder of the DSO for his unexplained skill in a D.E. 2c on the Zepplin-shed at Grasse, he was to become even more famous in a little Bristol Scout.

It was July 25, 1916. Flying a routine patrol over the Ypres salient, Hocken spotted a German two-seater. Ignoring the enemy's machine gun, he attacked and sent the plane soaring for home.

Twenty minutes later, over the Houbaux Forest, he came upon another two-seater, about his Lee-Enfield rifle as long as his coat. At the pilot's engine and forced the Germans to the ground.

He claimed to have downed 220,000 feet. There was a two-star Allies below him. Hocken drove down one of the sun, his smile, chip-fil-curtain cocked and ready, the man and a rifle spread one more and a machine gun. Hocken won.

As the Allies went down in smoke and flame, he flipped over, dropping the observer like a bomb. On the dead man's clothing, British soldiers found the pictures of four German ladies, one of which had escaped the prayng search of aerial pilots for many weeks.

For his spectacular feat against almost impossible odds, Captain Hocken was the Victoria Cross—the first time English's highest honor was given for aerial combat.

Leach played a leading role in one major battle of World War I—the 26-minute dog-fight to the death with the famous Baron von Richthofen, "The Red Knight of Germany." That was November 22, 1918. The last day of his life.

You really admire those World War I pilots, don't you?

Everyone does. They were true patriots. But then you're something of a pilot yourself. You see, Leach has been contributing new knowledge to the aviation industry since 1919.

You began by making relays exclusively, right?

Right. And down through the years, Leach has been the leading designer of new relays for every type of aircraft. Fast fact, today there's hardly an airplane or missile that's not equipped with Leach relays. How come?

It's a new Electronic Time Delay Relay with printed circuit construction and a timing range of 3000 milliseconds to 60 seconds.

But aren't relays only part of what you do now?

Right, again. Leach makes data recording and telemetry equipment as well as accessory electronics. This is a completely manufactured two watt Telemetry Transmitter recently developed by Leach to meet the stringent demands of the missile and space industry.

Don't you mean recently?

Yes. But only to our new corporate headquarters in San Mateo, California. Our manufacturing facilities remain in Los Angeles and Akron. We also have other offices in San Francisco, New York, Washington, D.C., Dayton, Seattle, Boston, Hanover, Zurich, Munich and sales representatives around the world. Can we help you? A letter to Leach is a good way to find out.

Anything on Earth  
can be put into  
J M Thermomat -  
the most versatile  
asbestos-phenolic  
molding mat available

Electrolytic compounds, titanium dioxide, potassium titanate, asbestos and aromatic fibers—these are some of the things we have already added to J M Thermomat. What

else can be added? You name it. Whatever you specify, Thermomat can load it. What's more, custom formulations can be made for you at little or no extra cost.

On the site, Thermomat has a lot to offer, too. It is a pliable, conformable product that readily lends itself to molding. Tape winding and banding is also available. Thermomat gives parts and components rugged protection in critical terms. Because the asbestos fibers unique fire-resisting during molding, Thermomat provides uniformly reinforced parts that

offer minimum resistance to heat transfer as well as to ablation and erosion. And, they have a high strength-to-weight ratio.

Thus far, more than a hundred different formulations of Thermomat have been produced in either cast thicknesses and weights. Yet it is but one of a wide variety of asbestos materials made by J M for use in molding plastics. The widest range of such materials available to the aerospace industry. For details, write to American Products Group, Johns-Manville, Box 14, N.Y. 100-26. Or, address Johns-Manville

Pacific by 1966. Test base will be on the site of Marana, with support operations at Peoria, Tulsa, and an initial capacity of handling large jets on the site of Hix, about 350 mi. northeast of Marana.

West German government plans to appropriate about \$7.5 million in aid this year among civil aviation programs—namely, Heinkel's HB-711B regional transport and Hanseatic Flugzeugbau's HB-320 H. The two-fighter executive aircraft, first of next year may grow to about 517 aircraft.

Production of C-130 Hercules is expected to reach rate of 14 a month by the end of the year. Lockheed Georgia Co. (Fort Oglethorpe) is programmed to be fitted out in August, with initial flight date before 1964.

Fairchild Stratos Corp. and Sustech's Polaris Aircraft Works, Ltd., are negotiating a license agreement under which Fairchild would produce 200 to 400 eight-place Turbo Porter utility aircraft during an initial three-year period.

Pilat Aircraft Co. has been awarded a follow-on contract for 137 CH-33C observation helicopters for the Army. First deliveries will be made during the latter part of the year. The additional bar is from funds appropriated for fiscal 1963.

Loring Div., Avco Corp., has a \$7.4-million Air Force contract for production of high-altitude T33 jet fighter aircraft. Customer calls for an initial batch of 2,694-hp T33A-7 engines for YAV-8B CH-53 Chinook helicopters.

Bendix Field Engineering Corp. has received a \$1.5-million contract to fabricate and maintain services for maintenance of earth dams and support of ground communications. Electronic equipment, vehicles, and fixed sites in Western Europe.

Aerospace Ammunition, Inc., Cedarville, Md., has a \$1.5-million award for additional work on production of training missiles for the Army's Nike-Hercules anti-aircraft missile. This principal aerospace task will be carried out by the contract research organization, engineering and field service, documentation, and an early production system of the complete system to be used later.

International Telephone and Tel. Corp. has broken ground for a \$3-million unit of the ITT Electron Tel. Div. near Elstam, Pa.

The proper file to load in instruments that photograph a tiny target in a great big sky, especially through haze, is

Carlsbad Park, California

Propulsion payload module of the General Electric Mars manned module, above left, has a winged Mars reentry module forward of the tank. Vehicle is designed to land two tons on the surface of the planet. Three tank reentry vehicles, above right, would each carry 90,000 lb. units of liquid hydrogen, would be launched in conjunction with the basic vehicle.

## General Electric Proposes Nuclear-Powered Mars

Exoion vehicle detaches toward the Marsite module with all but one fuel tank expended and jettisoned. Six tanks would be jettisoned to achieve a transfer ellipse. En route, the chemically propelled reentry module functions as an emergency escape vehicle.

General Electric Missile and Space Dev has conducted extensive studies of a manned Mars landing mission, illustrated in the accompanying photographs of a model built to support the studies. The results of the study are being presented to NASA, the National Aeronautics and Space Administration, which has requested proposals for a number of automated Mars mission studies (AW May 13, p. 59).

GE concept is an 18,000-lb. nuclear-powered spacecraft assembled in earth orbit after launch by three Saturn 5s. One Saturn 5 would jettison a payload-propulsion module, and the other three would carry every lone propellant tank.

Propulsion unit is a hot-fission nuclear reactor of THERMIE (thermonuclear) specific impulse. Mission duration is 15 months, starting launch in April 1971.

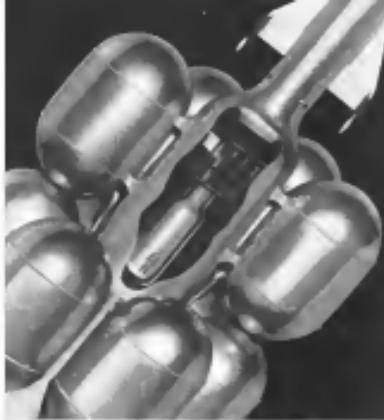

Fuel tanks are attached to the propulsion module in earth orbit, above left. The nuclear powerplant uses a fast fission velocity initial state, considered promising for multiple restart and cold source reentry qualities. Two tank reentry module, above right, would carry 90,000 lb. units of liquid hydrogen, would be launched in conjunction with the basic vehicle.

## Vehicle for 15-Month Manned Landing Mission

After a five day explosion period, exoion module is launched from Marsite orbiter, above left. Two man reentry is similar to Gemini in configuration. Exoion module would then rendezvous with the command craft, as an orbit with a 200-m. perigee. On return to earth, Marsite would enter a parking orbit around the planet, above right, and await rendezvous with a ferry vehicle to transport men to earth. Ferry Mars vehicle would reenter in earth orbit.

Space required for subminiature passenger cabin was reduced from 2.5 cu ft to only .6 cu ft when the FLEXPRINT cable replaced a conventional cable approximately 2" in diameter. Total weight of the assembly was reduced from 105 lbs to just 20 lbs, of which the FLEXPRINT cable weight represented 3 lbs, as compared to 16 lbs for the old wire cable. The FLEXPRINT cable contains 24 conductors, is 3" wide and 47" long.

Packaging position for a 20-channel multi-player station update has been solved without the FLEXPRINT RETRACT cable. Measuring only 7" in total it extends to over 22" when the flexible cable is pulled out. - rolls on ball bearing release and return to the home-drawn stage. In life testing, the FLEXPRINT RETRACT cable survived the cumulative equivalent 100,000 cycles with no apparent change in any part of the cable.

## Throw away your old ideas about wiring!

FLEXPRINT® flexible printed circuitry makes an engineered component out of wiring! This means you can take entirely new directions in the design of new equipment... create packaging innovations never before possible. Or... replace the individual wires in your present electrical and electronic assemblies with a single engineered component.

FLEXPRINT circuitry consists of thin, flat conductors custom-designed to desired length, layout and current-carrying capacity to

meet your exact specifications. These conductors are permanently bonded between two thin sheets of flexible insulating plastic that meet your dielectric and environmental requirements.

FLEXPRINT circuits let you shrink the size of your equipment to as little as 25%, reduce weight to as little as 50%. They can be rolled, folded, and preformed to fit the shape of any package... they provide more reliability than traditional wiring... and, they save time and money on the assembly line.

FLEXPRINT circuitry is distributed by numerous sources and is patent in the U.S. and abroad. MITSUBISHI ELECTRIC CORPORATION.

CREATING NEW DIRECTIONS IN ELECTRONICS

## NASA Outlines Reusable Booster Studies

By Edward H. Kolom

BELTS — Unconventional reusable booster, designed to reduce launch loads for nonastronaut passengers, was described here by L. T. Spears of National Aeronautics and Space Administration's Marshall Space Flight Center.

The concept is fundamentally an airplane-like vehicle which re-enters at orbital acceleration on the ground, takes off horizontally, and employs a winged or braced or an augmented tail that is flown back to the earth for reuse.

Spears discussed the vehicle and its potential at the American Institute of Aeronautics and Astronautics Midyear Space Flight Meeting here recently (AW, Aug. 25, p. 16). He reported largely a continuation of findings based on NASA's X-24B studies conducted by Boeing, Long Beach-Vought, Lockheed and North American Aviation.

He hypothesized that future space travelers will be of varying ages and physical conditions. Consequently, the most constraint in design is a 34 kg maximum flight acceleration, with 4g under short conditions.

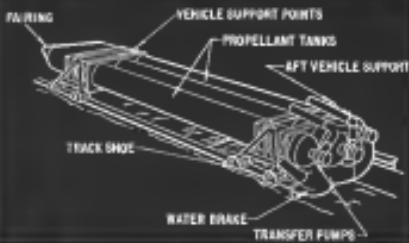

Both horizontal and vertical launch were studied, but with the nonastronaut passenger requirement, horizontal takeoff was selected as preferable. In addition to reducing launch acceleration, it simplified preparation of the vehicle, passengers and payload, according to Spears.

Vehicle liftoff weight is kept at a minimum because the heavy interstage and central booster propulsion system is on the ground. Two basic ground acceleration concepts were proposed (see drawings).

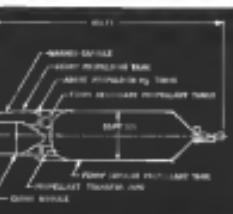

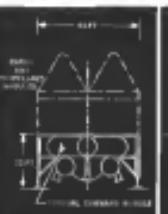

• Liquid propellant rocket sled. This is similar to sleds now in use, except that the flight rocket motor provides propellant gas for the sled. The fuel used for the initial boost is replenished from tanks carried in the sled. Because of boost propellant operation from the sled of the ground, the complete launch system can be checked prior to liftoff to insure proper functioning of the sled, the rocket motor and the rocket before this vehicle leaves the ground.

• Liquid storage tanks. Although this option has not been studied in as much depth as the rocket sled, a greater range of maneuverability is attainable from stored gas by exhausting through rocket nozzles. This concept requires nozzles along a track.

The sled concept reusable booster vehicle is conceived in two basic forms: the first is based on Saxon 5/Apollo technology designed to transport 10 passengers plus crew and a limited cargo.

**LINE DRAWINGS** show two concepts for propelling a ground connector which will boost a heavy or shuttle vehicle for orbital operations on a horizontal track. At top is a basic version, employing carbon blades along the track, with a winged reusable booster positioned in the launch configuration. Below is a sled propelled by liquid rockets. In the sled concept, the propellant tanks would replace tanks on the rocket vehicle which would be used to give the sled its acceleration.

**CONCEPTUAL LINE DRAWING** shows a possible nuclear-boost vehicle and laser shuttle vehicle. With the dimensions listed, the laser weight 510,000 lb and can carry 23 passengers and 30,000 lb useful payload. The propellant for the shuttle, once off the sled, uses a propellant tank. Concept of the laser shuttle vehicle is based on a system of RL-10 hydrogen engines.

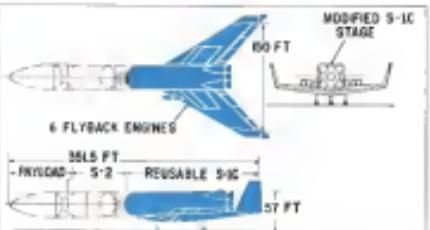

## HOW PI TURNS OUT A BETTER TAPE TRANSPORT

—by supporting it on its centerline. The transport is thus freed from one of the most vexing problems besetting users of instrumentation magnetic tape recorders—creeping misalignment. The PI 400 will never suffer from this malady, you can expect it to perform its function superbly, rendering tape worse than the heads, day in and day out, with everlastingly precise alignment.

Every moving part associated with tape motion (and there are fewer than a dozen) is anchored rigidly in place to the same reference plane, and all rotating axes are parallel within less than a minute of arc. The reference plane is shaped into a ribbed, rectangular box frame casting which is structurally and functionally massive, yet finely balanced and light in weight. The entire transport assembly can be rotated about

its centerline, even during operation, without imposing any unbalance or in any way affecting the precision tape handling function. An important side benefit is the complete accessibility of not only the rear of the transport, but also the slide-out power supply and servo control chassis.

The turnabout transport is but one of the many advanced design features which make the PI 400 stand out from its contemporaries. Others are as follows: bidirectional tape speeds; switchable electronics; error-proof, logic-protected tape motion control circuitry; and complete accessibility during operation of every component of the recorder. May we arrange a demonstration of the PI 400? If you'd like to see the literature first, address us at: **Precision Instrument Park, P.O. Box 21, Centerville.**

FEATURES OF A SATURN S BOOSTER modified as a recoverable stage are shown in the drawing. Flyback engines could be solid or turbopump engines. Span of wings is comparable to that of B-52 and C-130A aircraft.

and the second is based on a Saturn 5 with a nuclear escape stage and a reusable 27-passenger reusable lunar Spaceliner. Spaceliner would be mounted on the side of the second stage. Although Marshall has concentrated on the rocket side of the spectrum while others have studied air and air-breathing boosters, these are potential in a number of these two propellant systems. An examination of rocket performance and reusability, however, has not, could reduce launch-to-orbit response time and payload for longer flights within the atmosphere.

The vehicle is thought to be a requirement for operation in earth orbit, and for a lunar exploration base. In a typical earth orbit mission, Spaceliner would be accelerated on the ground to a velocity of about 900 ft/s in 5,000 ft or less.

Liftoff would be followed by a full stop climb, followed in a nose-over-to-a-side path angle of 20 deg at first stage burnout, when the winged booster would separate from the rest of the vehicle. The booster would decelerate and descend from the orbital velocity of 16,000 ft/sec to speeds below 100 ft/sec and fly back to the launch site using solid-state turbopump or turbopump engines.

One concept here draws on engines the Saturn 5-M boosters modified for staged descent. This system would use existing PI engine technology to provide an orbital ring orbit of the earth 1970s. The 150 ft span of the wings compares with the span of the B-52 and C-130A aircraft.

Lunar transportation would be supported by a reusable lunar base of about 90 tons could be set up in orbital and base facilities and once the support equipment base construction and support equipment and return vehicles. Although some of the payloads will be only one-way trips, Spaceliner, if it can be developed to develop a single mission which can make both one-way and two-way trips.

propulsion system that can meet the demands of the mission. Design options, compared to B-52, Nova, C-130, etc., take the base stage base the power level to fire from the landing Mtns, since to right now the number of starts and base the efficiency is thrust-to-weight ratio.

Objectives in the reusable booster studies Spaceliner and, are comparative analysis of major candidates is still early depth in that a choice can be made. Various studies of candidates concepts and supporting research in space technology. If these objectives are met, a valid choice can be made of rocket or air-breathing for a combination of the two at the optimum weight for a re-usable boost system.

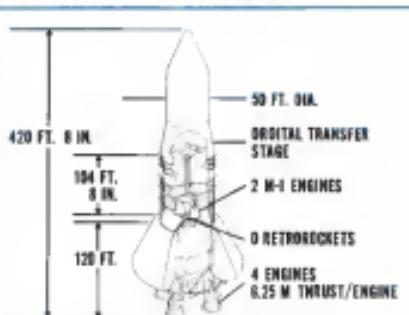

These are the studies aimed at finding answers in critical questions about a nuclear boost vehicle.

• Performance studies to determine requirements, development problems, feasibility and availability for a variety of space missions.

• Design studies of the nuclear boost of the Spaceliner and Nova vehicle classes. These studies include analysis of isolation environment, constraints and design of isolation, noise/temperature protection for long response time, cargo packaging crew compartment and abort methods.

• Operational analysis to determine how the system might integrate into the total space transportation requirements.

• Orbital operations studies to determine requirements for arriving and launching nuclear-propelled orbital launch vehicles.

GENERAL DYNAMICS/ASTRONAUTICS concept for a fully recoverable and reusable booster based on hydrogen-oxygen propellants. Booster is a cluster of four engines, each developing 6.25 million lb. thrust.

**VJ-101C SIDE VIEW** shows the puffed engines with the nozzle slat closed. Holes in the pod and in the fairing aft of the nozzle, where two Rolls-Royce RB 147 lift engines are positioned, may be heating points. Prototype has flush gear.

## VJ-101C Effort Is Directed to Possible

Munich, Germany—Test flying is nearing flight of Europe's newest vertical takeoff and landing strike fighter, the West German EWR/Stad. VJ-101C, in the extension of a design and development program started four years ago when Bölkow, Heinkel and Messerschmitt pooled a design team to form EWR/Heinkel/Heinkel (EWR).

Armed at possible production of the far more advanced supersonic VJ-101D fighter, the program now centers on two prototype models of the C version, the X-1 for subsonic flights up to Mach 1,

and the X-2, for Mach 1.8 speeds (AW Mar 22, p. 55).

No decision has yet been made as to building the VJ-101D (AW Dec. 1, p. 10). Production version details have not been revealed, but the airplane will be considerably different from the two VJ-101C prototypes.

Engines will be landing/recovery and probably will be Rolls-Royce RB 147 bypass turbofan, which are designed for use on the X-2. The delta-wing airplane would be capable of Mach 2 plus specific.

Rolls-Royce RB 145 power lift or canister power for the two prototypes, heat mounted in mounting wings pods and bin mounted in the fuselage, had the pressurized cockpit. Swiveling nose from vertical to horizontal is a 6 sec.

Only change between the X-1 and X-2 is that the latter version will have RB 145 engines fitted with afterburner that can be used during the vertical lift off phase.

In discussing the concept, Karl Schwerder, EWR/Stad. director, said

**TESTS CONDUCTED** by Bölkow in inverted takeoff wind tunnel (left) and a one-eighth scale pod of the VJ-101C swiveling engine. Puffing tests on complete pod mounted on test wing flight were made by Rolls-Royce flight development establishment.

**ENGINE PODS ON THE VJ-101C** are shown nested to 45-deg. angle. Wind and gust cover the intake ducts which run around the engine pod and provide additional air during the VJ-101C phase. Slats are closed for conventional flight.

## Mach 2 Version

the VJ-101C project has these aims:

- Total installed power is available for vertical takeoff with no thrust loss resulting from thrust deflection.

- Transition is simplified through use of the ramming engine.

- Control during vertical takeoff is by thrust modulation, and thus there is no need for control surfaces and complicated docking systems. There also is no thrust loss due to bleeding engine air for control nozzle effect, according to Schwerder.

- All fuel can be stored in the main fuselage and atmospheric tank bags kept simple to reduce weight. Weight is three times of the aircraft reportedly at 6.9.

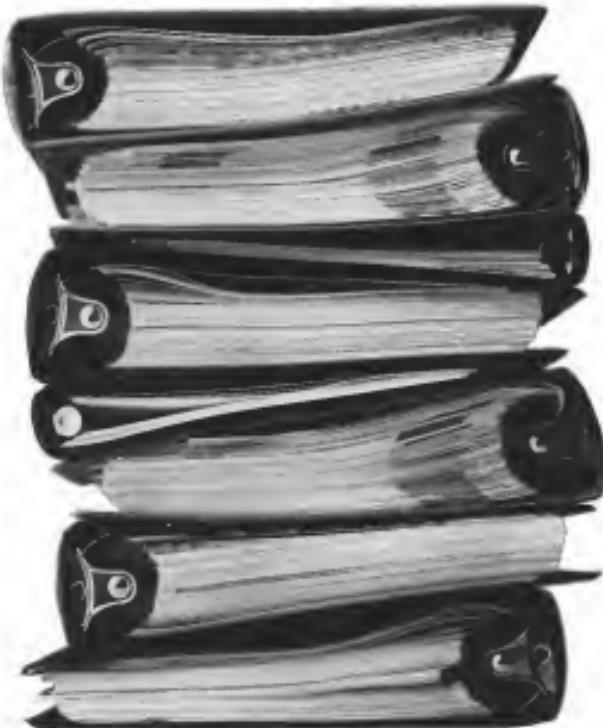

Schwerder said studies leading to the VJ-101C concept took into consideration the three European VTOL designs now flying: the Short SC 1, and Breguet Balsac, which has separate lift and propulsion engines, and the Hawker P 1127, which uses a vectored thrust duct.

Since the design team felt that it was more advantageous to use the thrust of the propulsion engines for lifting the aircraft, the VJ-101C project emerged as the most favorable solution. Two engines in each wing pod are positioned behind the center of gravity, and the two large engines are rotated forward of the centerline.

Decision to build the two prototypes followed extensive tests in subsonic and supersonic wind tunnels, none of which were undertaken by Rolls-Royce at its Hucknall, England, flight development

**WEST GERMAN EWR/Stad. VJ-101C** shown with wingspans in vertical position. Engines are mounted for flight test photography. X-101 is the X-1 version which will be used to investigate subsonic flight area. Extra lift engine, smaller project from bottom of fuselage.

### We get our information...

from a very reliable source.

How will Fairchild transistors stand up under missile launching stresses? Or is a guidance system north of the Arctic Circle? Or in an orbiting satellite? Getting the facts is a tortuous process—for the transistors. They undergo alternate extremes of heat and cold. Measure Shock Constant acceleration of 20,000 G's. Then they must operate continuously for 1,000 hours at a high temperature.

These tests are part of the Fairchild routine. The volumes of information they provide tell our customers what they can expect from Fairchild transistors. And because Fairchild transistors can take the worst, our customers can expect the best.

**FAIRCHILD**  
SEMICONDUCTOR

# Are you looking for trouble?

(Here are 8 ways to find it.)

The Datco automatic checkout system isn't just an idea. It's for real.

All eight of the Datco configurations above are in use by the Army, Navy, or Air Force. They're all configurations of the same basic Datco concept.

Datco uses a unique "building block" principle. All components are already in being. These components can be selected and assembled to suit the checkout needs of any space or weapon system.

This building block concept makes Datco an extremely versatile system. If the weapon system changes, you keep the same Datco. If you want to check out a different weapon system, you keep the same Datco. Sometimes new modules may be needed, but often the only change necessary is the

rearrangement of the Datco tape that feeds Datco instructions.

For example, the configuration of the Polaris missile has changed three times. The same Datco checked them all. Aboard the new Polaris submarine, Datco is operating day and night, 365 days a year, with less than 1% down time.

Since Datco was introduced in 1967, it has logged thousands of hours of successful checkout, saved thousands of man-days of test maintenance effort and saved millions of dollars in military expenditures. Which only goes to show that Datco is a good thing to have around in case of trouble.

**NORTHROP NORTRONICS**

2000 NORTHROP DRIVE, SANTA MONICA, CALIFORNIA 90406

test facility, and is Man-Turbomatron GmbH.

The two engines form a triangulated group, giving a total life thrust of 16,900 lb. Stabilization is achieved by swiveling the thrust of the pair of the engines independently. For normal flight, the two fuel-depletion valves are closed and the control nozzles return the engine to a stable state.

The RB 115 engine is a derivative of the RB 118, designed in collaboration with Man-Turbomatron. Afterburner nozzles maintain a fuel/air state using from 2,750 lb to 3,650 lb thrust.

Because the VJ-101C is the first VTOL aircraft to use only engine thrust for control, Schmidauer said, a complete series of tests resulted in confirmation of the Wippe maneuver and a free-flying hovering test.

The Wippe is a horizontal beam supported at one end. It can swing up and down at the other end. At RB 115, the engine is placed at the bottom to stabilize the oscillating end. In fact, the air of the pilot's seat must be repressed and the arrangement of the left engine and the pilot's seat is similar to that of the VJ-101C, and the use of oscillation corresponds to its pitch rate.

To hold the Wippe in horizontal attitude, or my desired angle of incidence

to that of the engine, the pilot uses a throttle lever to find the approximate position of equilibrium. In addition, the control column enables him to turn the plane by  $\pm 10^\circ$ .

Schmidauer said that by matching the static position and moment of inertia of the Wippe, complete simulation of the VJ-101C control system can be achieved in the pitch axis.

## Roll Simulation

When the pilot's seat is removed from the front end of the Wippe and tilted sideways parallel to the axis of oscillation, roll can be simulated. Flight characteristics also can be simulated by pressurizing suspended weights.

For the next stage, EWR-Sed built a free-flying hovering rig. Fitted with three RB 118s, installed in an inverted fuselage made of steel tubing, it is enclosed side-by-side at the same distance from the cg as in the VJ-101C. Landing gear is at the same as on the aircraft, with respect to track, wheelbase and cg.

Testbeds are on a platform, which can be rotated by installing a Caster joint at the cg.

Engine thrust was deflected through underground ducts.

Development of the hovering rig was not pursued when it was found that a cost or weight for jet deflection was at least as high as for engine mounting. Also the thrust loss in this direction is avoided in the latter system.

When the rig was 3 ft off the ground, there were no noticeable

ground effects. Since Bright's first flight, more than 70 flights of the aircraft have been made, some in adverse weather conditions.

With parameters determined by the wind-tunnel studies and successful results of the two rigs, the VJ-101C was built. Both of the light aircraft structures with titanium and steel used in the test section Schmidauer pointed out that structure is clean and simple, since there are no engine mountings to clutter the fuselage cross section.

Wing extends through the fuselage and is attached to its belly. Left engine compartment below the pressure cabin and its engine unit. Behind the compartment are two large fuel tanks. Nose section has been designed to accommodate a radar mast and two transverse equipment.

## Initial Test

Initial testing of the X-1 prototype was conducted on a potential field. It made its first free hovering flight April 10. Schmidauer said, the aircraft system with running jet bags. He noted that no changes have been necessary in either the aircraft or airframe design.

Forward, Schmidauer said the

gauge a sufficient good pressure data taken at the engine inlet under all conditions of oblique approach flow during hover.

Use of thrust modulation for control in VTOL flight were from the triangular arrangement of the engine in a planform. After the engines have been started, thrust balance are switched to one common throttle lever with which each thrust can be controlled separately.

Thruster control for pitch and roll is controlled in the aeroelastic flight control system in that manner of the control column position, corresponding adjustments in the thruster layout.

Aeroelastic events are controlled during hovering, but an indicator on hovering pods to the horizontal position for hovering, thrust control a gradually switched off in the same degree, is the aeroelastic control becomes effective with forward speed.

Several foreign firms have participated in the VJ-101C program. In addition to Daimler-Benz, it is represented by British Royal Aircraft Establishment, and are also for jet fuel and roll. In general, the program is suffered from the same EWR-Sed is working with Messerschmitt-Bölkow-Blohm and Bölkow-Friedrichshafen, and EASA, as a testbed development.

Development of the hovering rig was not pursued when it was found that a cost or weight for jet deflection was at least as high as for engine mounting. Also the thrust loss in this direction is avoided in the latter system.

Stabilizing augment also presented the use of steering augmenting powerplants for the

roll pitch and responsive flight. Two solutions to the initial problems were explored, one based on a large-diameter bell housing in the nose end of the pod about which the pod rotated, and another incorporating a hollow shaft passing through the join between the two engines. The latter version was selected for the two-expansion aircraft.

## Control Rigs

Control rods for engine operation passed through the hollow shaft, along with the necessary piping for fuel and hydraulic fluid. Aim was to reduce as much as possible the number of services in the shaft. For this reason, engine is started hydraulically to allow the same to begin shortly creating a hydraulic pump. The pod is swivelled by a hydraulic jack which has two hydraulic piston arranged in tandem.

Complex design area was construction of the air in intakes, because of the high-velocity species which will be generated by a 7.7 percent of the VJ-101C. Solutions were to slot and which is produced by moving the extra intake section forward. Schmidauer said the gauge a sufficient good pressure data taken at the engine inlet under all conditions of oblique approach flow during hover.

Use of thrust modulation for control in VTOL flight were from the triangular arrangement of the engine in a planform. After the engines have been started, thrust balance are switched to one common throttle lever with which each thrust can be controlled separately.

Thruster control for pitch and roll is controlled in the aeroelastic flight control system in that manner of the control column position, corresponding adjustments in the thruster layout.

Aeroelastic events are controlled during hovering, but an indicator on hovering pods to the horizontal position for hovering, thrust control a gradually switched off in the same degree, is the aeroelastic control becomes effective with forward speed.

## They didn't go with Cooper

These Collins radios didn't make the flight with Mercury Astronaut Gordon Cooper. He didn't need them. □ Previously, from Aerospace Research through Schenck, these radios served as part of the spacecraft back up communication system. But on NASA's Mercury Atlas 9 flight it was desirable that weight be reduced and room be made for extra life support materials. □ To meet the space and weight requirements, officials of the NASA Manned Spacecraft Center faced an important decision. To gain space and reduce weight they determined it would be safe to remove the back up radio units. They based their decision on the dependable performance of the primary communication system in previous Mercury flights. And the success of the Mercury Atlas 9 piloted by Gordon Cooper proved them correct. □ The back up system "left at the god's" demonstrated the reliability of the spacecraft's primary communication system. □ Consisting of voice, command, receive radios and radar, the Mercury spacecraft communication system was supplied by Collins Radio Company in cooperation with a team of skilled subcontractors.

## AVIONICS

# Survivability of Wire on Moon Tested

By Philip J. Klos

Washington—Only two types of insulated wire reported suitable for use in the harsh environment and even these require special treatment to remove any deurable contaminants, Hughes Aircraft Co.'s H. S. Adams reported here during the recent Electronic Components Conf.

The conclusion is based on extensive tests conducted by Hughes prior to selecting insulated wire to be used in the Surveyor lunar spacecraft which the company is building for National Aeronautics and Space Administration.

Lunar environment is a rugged one for avionics components. They will be subjected to the extremes of -360°F temperature of the winter night with rapid transitions to the lower day temperature of 280°F.

During the high-temperature extremes of the lunar day, there is no air to provide convection cooling. The vaccines of the sun are estimated at 17°-20° above the Big Dipper. Under these high-temperature vacuum conditions, there is a danger of outgassing from the wire insulation, with the possibility that the material can condense on the optics of one of several TV cameras and on Sensors. Or if the material is partially conducting, it can conduct as a cold surface and cause a power short circuit.

With no air for cooling of the 280°F temperature, the normal insulation loss capacity of wire must be limited. Under the extreme cold condition, there is danger of having a cable which would not permit flexible bending and the load on wires during motions generated by flying cable is greatly increased.

With these problems in mind, Hughes launched an investigation of different types of insulated wire. Initial tests in which a variety of insulated wires were subjected to liquid nitrogen temperature (-319°F) showed that some types of insulation were very brittle because of brittleness at this temperature. These included polyethylene wire, polyurethane, and silicone.

For detailed tests, the field wire was used to wire various units made of TFE Teflon, an PTFE Teflon, coated with a modified polyimide, higher layers of Teflon, and insulated polyethylene. The last is less vulnerable to radiation damage than the first two but Hughes found it should not be used with aluminum foil. For that reason, insulation substitutes were

not considered a major requirement for Surveyor.

Based on Hughes tests, Adams reported the following conclusion is to the status of selected wire for Surveyor:

- **Copper/Alum.** Alum 61 and copper wire are both suitable for Surveyor. Alum 61 had about 10% less conductivity than copper but is demonstrated, rounder and greater lengthwise under flexing tests at room temperature and one atmosphere. This should prove one of a choice of wire size of 24 AWG with Alum 61 instead of larger 17 AWG for copper wire, providing about a 15% savings in weight, Adams said.

- **Brass/Steel.** Since often the best compromise of properties of the wire is a combination of high temperature stability and high strength, TFE Teflon exhibited slight loss in temperature. Insulated polyimide is lighter but exhibited the highest outgassing of the three test's.

- **Coaxial capacity.** TFE Teflon wire experienced the least temperature rise in other test in which the current through

is circulated linear for environment, but the difference is not temperature gain were small.

Hughes investigated the possibility of cleaning the three types of insulated wire by first exposing them to a vacuum of 10<sup>-4</sup> torr at a temperature of 260°F for a week. Then they were exposed to the 17° torr simulated lunar environment to see if the subsequent outgassing could be eliminated or reduced. Hughes found that such pretreatment greatly reduced the outgassing from TFE Teflon and Steel, but had little effect on the insulated polyimide insulation. However, Adams concluded that a longer period of exposure during the preheat test process will draw out contamination from the insulation.

During the simulation outgassing was conducted at temperatures of approximately 360°F and a pressure of about 10<sup>-3</sup> torr, after a week's exposure the insulated polyimide had lost 0.21% of its weight. The Steel had lost 0.21%, but there was no detectable loss for the TFE Teflon. Adams reported. In an other test in which the current through

## Transistor Circuit Failures Traced

Washington—Recent investigations indicate that certain transistors may be responsible for previously unexplained failures in solid-state components widely used in aerospace industry, W. G. Bailey, General Dynamics, Flights Components Division, the recent Electronic Components Conf.

Cooper designs either are not aware of the source of such transistors or do not realize that solid-state electronic component failure is often due to voltage spikes which voltage exceed the voltage rating of the device field test.

The transistor rating is held to 10% of its rated voltage, and that circuit should be analyzed to determine the wave shape, peak voltage and repetition rate of any transients occurring across the capacitor. If the transient pulse width is less than 20 microseconds and the repetition rate is less than a few pulses per second, no thermal problems can be expected.

But if the transient is changing the capacitor to more than its rated voltage, a circuit with a compensated higher voltage should be used, said Bailey and For more severe problems, the peak changing voltage should not exceed the rated voltage or about 10% if operated at high temperatures.

An investigation by Boeing to determine the failure mechanisms and current stress limits for different types of electrical connectors shows that soldered joints are less reliable than solderless wire-to-wire joints, M. E. Arth reported. The performance of crimp connections depends upon the strength of the wire and the quality of the solderless wire-to-wire joint. The higher the temperature, the better the solderless joint.

For equipment designed to have a service life of five years, Boeing's tests indicate the following operating temperature limits for different types of connectors:

- **Wire-to-wire:** 100°F
- **Crimp:** 120°F
- **Solderless:** 140°F

The results of connector tests to determine resistance to possible mechanical shock indicate that wire-to-wire joints can withstand the highest shock levels followed in cycles by welded joints, solderless connectors, and crimped connections.

Ability  
has no color,  
no creed,  
no nationality

Seen through the window of a huge prefabricated "baff", a Surveyor Lunar Landing Vehicle undergoes assembly.

What kind of mind does it take to con-  
ceive and build a Surveyor Lunar Landing  
Vehicle, a Falcon missile, a revolutionary  
3-dimensional radar? It takes depth and  
breadth of technical competence. Highly  
developed imagination. Vision to perceive  
the usefulness of new ideas.  
One of these qualities is the inclusive  
vision of way more, need or natural  
background. Neither does man nor  
playboy have this effect.

At Hughes they work hard long hours on  
new ideas. Examples of only a few: Hughes is  
the first company to develop a self-aiming missile. In  
fact, in 1960 Hughes was one of the first  
to become signatory to the Peace Corps Pro-  
gram of the President's Commission  
on Equal Employment Opportunity which  
stands as a milestone in our nation's effort.

to achieve equal opportunity for employ-  
ment for every American.

Hughes researchers in the development  
of advanced systems and products help  
shape the future of our philosophy. Today  
Hughes has over 21,000 employees involved  
in lasers, ion engines, microcircuits, fibers, crystal  
filters and plasma physics. Important sys-  
tems

now in production include: Polaris Guidance  
Systems, the F-111B Phoenix Missile Sys-  
tem, TOW Anti-Tank Missile, Iridium  
Hyperboreas Global Satellite, major new  
satellite systems and products, advanced re-  
cording media, the Hughes Space and Earth  
Station, Hughes Integration, Assembly and  
Checkout, advanced 3-D displayed radar  
and Anti-Submarine Warfare systems.

**Engineers and Scientists** with vision in  
the unique opportunities at Hughes are  
invited to inquire. Qualifications include a  
degree from an accredited university and  
U.S. citizenship. Degrees are an equal  
opportunity employer.

For prompt attention please address: Mr.  
R. L. Colgate, Manager, Employment &  
Mangement, Hughes Aircraft Company,  
Culver City, California.

Creating a new world with electronics  
**HUGHES**  
HUGHES AIRCRAFT COMPANY

the wire in the 10" vacuum was re-  
covered until "interstitial outgassing"  
occurred, the irradiated polyolefin ex-  
panded outgassing at a temperature  
of 380°F, the Sanki at 300°F and the  
TPE Teflon at 57°F.

In tests conducted to determine the  
compressive capacity of different irradiated  
wires under simulated lunar vacuum  
conditions, using 24 AWG wire, the  
compressive strength of wire that had a 5%  
swelling rate, i.e., those in which the  
irradiated polyolefin must be heated to  
600°F, Sanki to 440°F and TPE Teflon  
to 460°F. For a 50% rate above ambient  
the respective breaking forces were  
4400, 4100 and 3600, Adams said.

An antenna array at Surveyor uses no  
slip rings to permit rotation, requiring instead  
the lashing of connecting cables.  
Since the stiffness of the cable at high  
night temperatures is a major factor in  
determining the rate of motion needed to  
drive the antenna, Hughes has tests to  
measure the stiffness of irradiated wire  
cables at -311°F. Using a 10-inch cable  
consisting of 16 strands of 24 AWG  
wire, the cable was found to have a  
U-shaped configuration at liquid helium  
temperatures. The TPE Teflon and  
Sanki insulation did not stick when  
heated through 300 degrees, but the  
irradiated polyolefin twisted with a  
bend in a 90-degree bend. The force  
required to flex the cable increased by  
a factor of 4.4 from the value of room  
temperature.

In tests conducted at room tempera-  
ture to determine the number of flex  
cycles a 24 AWG copper conductor  
could withstand before failure, Hughes  
found that the Allo, 61, operated for  
330 cycles before breaking while a cop-  
per conductor tested after 944 cycles  
had not broken. The irradiated wire before  
any radiation damage was tested but  
the test was conducted at room tempera-

ture. In tests conducted at room tempera-  
ture to determine the number of flex  
cycles a 24 AWG copper conductor  
could withstand before failure, Hughes  
found that the Allo, 61, operated for  
330 cycles before breaking while a cop-  
per conductor tested after 944 cycles  
had not broken. The irradiated wire before  
any radiation damage was tested but  
the test was conducted at room tempera-

ture. In tests conducted at room tempera-

330 cycles before breaking while a cop-  
per conductor tested after 944 cycles  
had not broken. The irradiated wire before  
any radiation damage was tested but  
the test was conducted at room tempera-

ture. The Hughes tests point up the fact  
that for the lunar environment the  
selection of over 1000 space-qualified  
copper materials as irradiated wire can  
not be taken for granted.

Also reported at the Electronic Com-  
ponents Conference:

• Vapor-deposited aluminum film resis-  
tors, when effectively protected  
against ionization, can be exposed to  
radiation as a source of energy for  
up to 15% of the 20,000 hours  
when used in typical aerospace en-  
vironment. A. G. Fowler of Intersil  
Business Machines Corporation reported,  
based on an extensive IBM  
test program.

• Solid electrolytic silicon capacitors  
a new type which exhibits capacitance  
of 0.01  $\mu$  farad per cu in at working voltage  
of 35 v, can be used at temperatures up  
to 400°C and should have a lifetime of  
more than 1,000 hours at the 400°C  
temperature, according to a report by  
T. Saito, M. Onogi, T. Saito and  
Y. Shima of Matsushita's Microelectronics  
Department.

Yoshio Itohawa and Shozo Inouye  
of Nippon Electric Company, Ltd.,  
Kyoto, Japan.

• Poly-carbonate connector, for connecting thin ribbon conductor without  
scraping off the plastic insulation,  
has been developed by Bondy Corpora-  
tion, Natick, Mass., under Army  
contract. The connector, which consists  
of a U-shaped frame that holds two  
ribbons of insulation, was developed in  
a report by H. H. Dorn, Jr., of Bondy,  
and Elmer P. Goodwin and George J.  
Ruth of Army's electronic research and  
development agency.

• RF shielded cable connectors, devel-  
oped for missile flying circuit operating  
in a high intensity electromagnetic  
radiation environment, was described by  
W. J. Marth of Amphibian Corp.  
Electronics Corp., which developed the new  
connector under Navy sponsorship.

• Radiation tests on solid insulation ex-  
pansion at levels of 300 megarads per  
hr., corresponding to the highest levels  
reported for the surface Van Allen belt,  
produced negligible damage to  
polymer insulation, plastic frame or heli-  
um temperature. The TPE Teflon and  
Sanki insulation did not stick when  
heated through 300 degrees, but the  
irradiated polyolefin twisted with a  
bend in a 90-degree bend. The force  
required to flex the cable increased by  
a factor of 4.4 from the value of room  
temperature.

## A fighting non-com meets the test

**Sperry Utah uses A-MP® Patchcord Programming Systems to test Army's supersonic ballistic missile—the Sergeant. Going the Sergeant system "before-combat physical" is the job of Sperry Utah developed Sergeant Mental Test System (SMTS).**

Currently used in more than 60 individual test programs in Sperry's Sergeant manufacturing process, SMTS could easily be adapted to perform 100 or 1,000 programs.

Key to SMTS's flexibility is A-MP Patchcord Programming System which makes possible production line, 4th echelon, depot, or other high speed, sub-synchronously level testing.

Some significant features of A-MP Patchcord Programming Systems:

- Double wiping action in contact design insures maximum conductivity at all times—even in the

- microvolt region of operation.
- Item persistent or permanent twin detect patchcards.

- Pre-insulated crimped contacts.
- Precise silk screening for multicolor circuit identification.
- Complete assortment of program system sizes in both universal and shielded types.

Get the full story on A-MP Patchcord Programming Systems. Send for complete details today.

## NEW AVIONIC PRODUCTS

• Multi-function logic element, single-chip device utilizing both bipolar and metal-gate technology, can be used to provide variety of computer logic functions, including AND, OR, NOT, NAND, Exclusive OR, bistable flip-

flops containing corresponding numbers of single-bit or multi-bit parallel adders, and a 4-bit by 1-bit serial-to-parallel converter. Four-way flip for 300-1 000 ns use has sweep bandwidth of 10 MHz at 5 db points with maximum insertion loss of 12 db. Device weight less than

5 g, more-stable flip-flop, multivibrator and inverter according to manufacturer. Presently available configuration has four high-impedance inputs and one output. Logic cell 1 has 4 bits of logic with four latches. Device logic network is packed at 505 in hermetically-sealed Monolithic Chipcarriers Inc., 117 Sherman St., Cambridge 48, Mass.

• Stretchable coaxial cable which can accommodate elongation of up to 100% without damage in multiple conductors is available with jacket of synthetic fiber plastic or silicon rubber. During stretching the elongation of cable remains nearly at 50 mm/1.97 in. per foot of elongation. Cable is suitable for interconnecting Miniaturized NASA 75-01 Queens Blvd, Long Island City 1, N.Y.

• Non-destructive die voltage breakdown tester, Model 7005A, does not damage test specimen nor endanger operator. Damage is prevented by auto safety clamping and test leads before breakdown occurs. Heating current available through specimen to three microamps duration. Meter on panel shows amount of voltage applied to specimen with maximum reading reading 1000 volt. Test is performed. Selector switch has two positions: 1000 volt test voltage and current of choice can be selected. Manufacturer: Microtest Inc., 270 Princeton Ave., South Pasadena, Calif.

2 lb and much miniaturized equivalents of MIL-STD-5440, according to manufacturer. Loral Electronics Corp., General Products Div., 425 Broad Ave., New York 72, N.Y.

• Laser output tester measures short-duration light emission from a fiber optic cable to test infrared (8.35 to 11.3 microns) giving readings of average power on a ballistic basis. Wavelength

and full time, duration and energy measurements can be displayed on a fast response.

Device is called Loral Model and has integrated detector head which is attachable to remote testing. Manufacturer: Edgerton, Germeshausen & Grier Inc., 170 Brookline Ave., Boston 15, Mass.

• High-speed current booster, with microsecond response time to instant and long term over-voltage and over-current, and low-loss shunt or sense. One model provides combined over-current and over-voltage protection while another

provides voltage limiting and automatic system recovery for short transient. Both are available either with post-pulse or trigger action in wide choice of terminal configurations and ratings. Manufacturer: Miniatronics Inc., 14 Firth St., Athlone, Mass.

• Pulse diode unit, available with pulse widths of 10 ohms to 25 nanoseconds, rated 1 watt at 127°C with sensible packaging. Maximum 0.063 in. thick by 0.10 in. in diameter. Temperature coefficient is quoted at less than 500 ppm deg-C be-

## Low-Noise Parametric Amplifier Advance

New self-oscillating varactor diode which enables a parametric amplifier cooled only to liquid nitrogen temperature (77K) to provide low noise performance comparable to that of a more complex mixer cooled to liquid helium temperature (4.2K), has been developed by AEL Division of Clevite Electronics (formerly Amherst Instruments Laboratory).

The development is another example of parametric amplifier performance advances which prove a short to noisy source and complex mixer amplifier (AW 1m, 25 pJ, 77K).

The 4.2K noise-temperature-cooled output cutoff frequency of 150 g (km/s) and noise figure no less than 4.0 db at 77K is when cooled to 77K. Consumer tests show that although this diode can use to 1000 g, enabling the device to operate for data for millisecond regions.

A 5.5 g degas-free parametric amplifier using the new diodes, cooled to 77K, exhibited an effective noise temperature of 10K at 20 db noise, and 7K at 30 db. This exceeds the performance reported in Lincoln Laboratory using gallium arsenide diodes cooled to 4.2K. The AEL diodes are defined abrupt junction type with zero base resistance of 0.1 to 1.0 picohm.

Varactors were developed by AEL's research department, headed by Dr. Bernard Schlegel, in association with Carroll M. Vilco and Paul E. Langley.

**INTERNATIONAL AIR SHOW**  
PARIS, FRANCE • JUNE 6 TO JUNE 16, 1963

Computing Devices of Canada Limited cordially invites you to visit their display areas in the Canadian Department of Trade and Commerce booth in Hall "C", and the Bendix International Booth in Hall "B" during the exposition. Advanced Air Navigation and Photo-Optical Systems displayed will be—

**PHD** — The Precision and Hearing In-  
stance, the prime navigation system  
used by the Air Forces of 10 nations  
will be demonstrated. The PHD 200  
most advanced airborne navigation  
system, will be presented, as well as  
the PHD 100 series for VTSR, light-  
and transport aircraft.

**TMND** — The Tactical Marine Map  
Display will be shown for the first  
time in Europe. This sophisticated and  
versatile navigation system offers the  
ability to continuously display on a  
large scale topographic detail in  
any position, precise aircraft position.  
Fully automatic map movement per-  
mits tactical display within an area  
1600 x 1900 nautical miles at speeds  
up to 2000 knts, and a display of  
track area, track range and course to  
fly for up to 12 preselected destina-  
tions.

**VICON** — The Terrain Photo Recor-  
nition System, now in quantity pro-  
duction for the RCAF's CF 104 is  
incorporate the results of extensive

data on such high resolution photo-  
graphs with automatic exposure and  
variable control features for line and  
high altitude missions at impressive  
speeds.

**CHS** — The Central Heading System  
consists of a central control unit and a  
16 ATR repeater. Controlled by either  
the pilot or navigator it accepts heading  
data from two sources, makes two  
influence independent heading compari-  
sons and selects the one which can be  
selected by the pilot. It also receives data  
from other heading sources and can  
select independently source of heading  
required in large aircraft.

**SAC** — Synchronous Auto Computer  
provides an automatically powered system  
utilizing a new method of auto-  
matic alignment of heading data by  
the use of wind vectors and three-axis  
control. A sub-section of Computing  
Devices' GADS system, the SAC is  
currently used by civil, airforce and  
military services.

### Make your aprons lighter and safer with Wide-Lite® floodlighting!

Safe, effective apron and ramp lighting is easy with Wide-Lite® mercury vapor floodlights because they put all the light right where you need it.

At the Dayton, Ohio, Mansfield Airport, for example, 1000 watt "Wide-Lite" fixtures are used to light the working and loading areas. Their broad light patterns tend to give uniform light that lets crews read tickets and bags anywhere along the line and gives safe, glare-free working light for servicing aircraft. The system is designed to keep light out of the eyes of flight crews during landings and take-offs.

Dayton's 1000 watt fixtures are also being used down south, with an original, die-cast aluminum body that protects the reflector — a lamp that lasts up to

16,000 hours before it needs replacing. Heat-and-shock resistant glass has that keeps dirt, weather and insects away from the lamp and reflector — and a precision lamp mounting that gives the lamp at least 10% and virtually eliminates breakage from shock or vibration. Even the "Wide-Lite" fixture is designed to slash maintenance costs — it is guaranteed for three years instead of the usual one year.

Why not head out all the way? Wide-Lite® fixtures can improve your lighting — airport and runway, parking lots, hangar interiors and service areas. A "Wide-Lite" representative will be glad to make specific recommendations. Just send the no obligation coupon.

## Skymaster Production Speeded by Cessna

Production of the Cessna Model 170 Skymaster is being increased at the company's Wichita, Kan., factory to raise that rate to one per day. Aircraft a 46-passenger, tandem-engine twin (SW Mar. 18, p. 18). Cessna recently began a worldwide sales tour.

## PRIVATE LINES

First Cessna Model 172s to be assembled in France by Revoir Aviation have been completed and current plans call for an increase in the monthly rate to support the first 10 aircraft per month. Revoir is 49% owned by Cessna. Production will be Revoir's responsibility, with final assembly of Cessna-produced components to complete finalization of the aircraft.

Federal Aviation Agency now is accepting plots to obtain a advance supplemental airworthiness certificate for one aircraft selected for use during photographic or similar operations. FAA also has published a list of civil aircraft approved for operations with a door removed. List covers Antonov, Cessna, Piper, Champion, Stearman and Taylorcraft single-engine aircraft, the Beech 180 aircraft, and the Cessna 172 and 182 aircraft. Pilots should make written application to the nearest FAA Civil Aviation District Office.

Champion Aircraft Corp. has received a type certificate for the Lancair 402 two-place light twin. Aircraft is powered by two 300-hp O-360A Continental engines and has a fuel capacity

of 60 gal. With deice system, the aircraft will sell for less than \$15,000.

Cessna is finalizing a new line of navigation and communications equipment under its own brand name. Known as the Cessna C-240, 900 and 1300 series, it includes a transceiver with 10-kc spacing between 115.00 and 135.95 mc, a 160-channel transponder switch with a 160-channel transponder and a 160-channel receiver and 30-kc spacing, and an antenna switch including 20 glide slope channels and a three-band antenna selection feature.

Landing gear for the Blanik/Breguet/Breguet 188-125 three-turboprop executive aircraft will be developed and manufactured by Hispano-Suiza. Hydraulically controlled main gear will rotate and swing forward into the front of the aircraft. Hispano-Suiza makes gear for the Concorde, Mirage 3V and Breguet 1050.

Edo Corp., of College Point, N.Y., earned \$115,000 on sales of \$1.6 million for the first quarter of 1981. First quarter 1980 net sales totaled \$45,000 on sales of \$1.7 million.

## CAREER OPPORTUNITIES IN THE AREAS OF DALMO VICTOR SYSTEM CAPABILITIES

Unprecedented unmet needs at the future often creates challenges. Dalmo Victor's contribution to the choices areas of specializations offer career opportunities in areas of vision, impedance and optics.

**1 AEROSPACE ANTENNAE** Implement link to the successful application of tactical and strategic antenna systems. Complete, high performance antenna packages for space and land, land mobile, ground mapping, fire control and a broad range of other products.

**2 AEROMARINE TRACKING SYSTEMS** Unique ground-based command and control tracking processor and ranging facilities for vehicles, including deep space penetrations. Dalmo Victor has the major ability of producing complete complete, turn basis design in aeromarines.

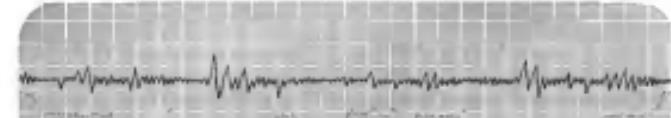

**3 MICROWAVE SYSTEMS** Dalmo Victor has been deeply committed to microwave systems for many years. Leadership has been maintained in laboratory, automatic tracking, countermeasures and distance measuring, with capabilities for mobile microwave communications and solid state terminals.

**4 MAGNETIC SYSTEMS** Another Dalmo Victor environment area, involving such applications as magnetic field, anti-submarine and underwater warfare, magnetic mine detection and magnetic control of aircraft and other applications in magnetism and its related fields.

**5 GROUND SUPPORT EQUIPMENT** In anticipation with California Testbed in麻田, another Taiwan company, Dalmo Victor supplies a wide range of ground support and ground environment equipment from a highly effective combination of its skills and talents. Dalmo Victor provides equipment unique source responsibility.

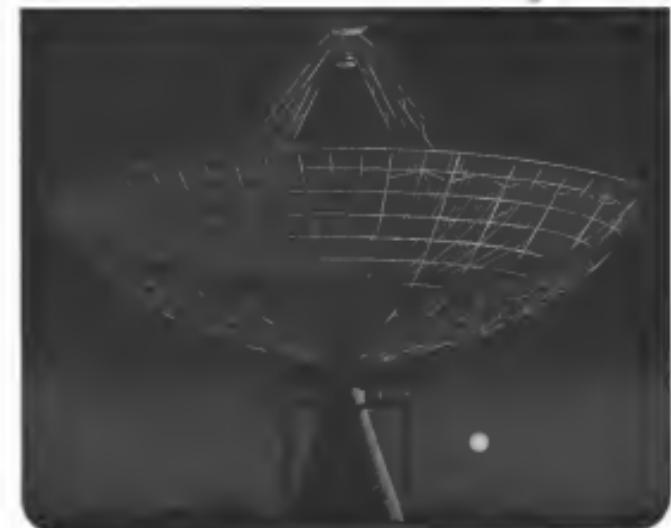

The truly capable describes one of the many Dalmo Victor environments. Technical and engineering of unusual difficulty are needed in further this and other Dalmo Victor concepts. If you would like to work in this creative atmosphere, and enjoy the many challenges of living in the San Francisco Peninsula, please write, telephone or contact with Dalmo Victor. It can be rewarding.

□ An Equal Opportunity Employer E

**MASER WITH DALMO VICTOR CONTROLS LISTENS TO A SPECK IN SPACE** Now the Rock of space dust or a deep space probe can be "heard" from 60 million miles out. With such sensitivity, the new maser instrumented and controlled by Dalmo Victor is designed to become an integral part of NASA's Deep Space Instrumentation Facility at Goldstone, California. □ The DVA maser control is part of an extremely low noise superheterodyne receiver operating with appropriate data processing units which feed vital information to the Goldstone instrumentation complex and provide radio astronomy data, probes or satellite data as required. This instrumentation system, built under contract to Microtron Electronics Corporation is another example of Dalmo Victor's fully integrated systems capability. DVA is in the vanguard of new developments in its major product areas. If you are interested in becoming part of these challenging programs, Dalmo Victor currently is inviting applications from qualified scientists and engineers. For further information contact: Director, Scientific and Engineering Personnel.

**DALMO VICTOR COMPANY** 110 INDUSTRIAL PARK - BELMONT - CALIF.

**LOOK AT LOCKHEED...AS A CAREER**  
Consider Lockheed's leadership in space technology. Evaluate its accomplishments—such as the Polaris missile, the Apollo vehicles' superb record of space missions. Examine its outstanding advantages—location, advanced facilities, creative climate, opportunity for recognition.

Then write for a brochure that gives you a more complete Look at Lockheed.  
**Address: Research & Development Staff, Dept. R-495, P.O. Box 800, Sunnyvale, California.** Lockheed is an equal opportunity employer.

**SCIENTISTS & ENGINEERS:** In addition to solid state physicists and chemists, other important openings exist for specialists in: Inertial guidance • Orbit thermodynamics • Electromagnetics • Mission & trajectory analysis • Gas dynamics • Chemical & nuclear propulsion • Systems engineering • Computer research

### LOCKHEED

**MISSILES & SPACE COMPANY**

Sunnyvale • Palo Alto • Van Nuys • Santa Cruz • Santa Maria • Colorado • Cape Canaveral, Florida • Huntsville, Alabama • Hawaii

An elegant, but hot refrigerator, utilizing the *Herschel-Strudelmann* effect, has been demonstrated in the Solid State Physics Laboratories of Lockheed-Martin & Space Company. This type of cooling is applicable below 200° Kelvin, where thermoelectric cooling is no longer efficient. It shows particular promise for space application because of the reliability inherent in its all-solid state construction.

In the *Herschel-Strudelmann* effect, heat is pumped on a result of a directed current flowing in a magnetic field. The heart of the present device is a length of many single crystal. Other crystal systems are also being investigated.

Lockheed scientists and engineers are also studying: Electron spin, radio phenomena; the interaction of electrons with microwave phonons; coupled traveling waves in crystals; semiconductor lasers; antiferromagnetic resonance; various theoretical and experimental aspects of superconductivity.

# MANAGEMENT

## Congressional Questions Remain Unanswered on GE Support Award

By Alfred P. Albrando

Washington — Disagreement within National Aeronautics and Space Administration over selection of the General Electric Co. to provide test support and housekeeping services at the Mississippi Test Facility apparently has been resolved. NASA last week still had unanswered congressional inquiries on how the selection was made.

House space committee members recently questioned NASA officials on the agency's fiscal 1964 budget request on both the original GE Apollo integration and checkout contract and its extension to cover support work at the test facility.

The agency did not reply. Rep. William F. Ryan (D-N.Y.) will be asking NASA to submit a written report to the committee, including analysis to questions such as these:

• Why was GE selected on a sole source basis to perform housekeeping services at the Mississippi Test Facility, that could be performed by any of a number of firms?

• Did Marshall Space Flight Center object to the NASA headquarters decision to select GE?

• Did Dr. Donald Holmes, director of NASA's Office of Manned Flight, agree to the selection or was it selected by NASA Administrator James E. Webb to negotiate with GE?

### GE Selection

GE was selected by NASA in February, 1962, as portion integration, checkout and related assistance work in the Apollo program.

At the time of the original selection, seven members of the House space committee were council of NASA because the agency did not select a contractor before the space competition (AW, April 2, 1962, p. 35).

House space committee members continued their critical questioning (AW April 22, p. 20) as the original contract that year. When Holmes and Dr. Robert C. Stinson, Jr., NASA as associate administrator, appeared before the hearing, and data acquisition subcommittee on April 9, they were asked if the agency planned to extend the contract. They replied that no additional work would be placed under the contract.

Then, on April 16, NASA announced it would negotiate with GE for exten-

sion of the original Apollo contract to include the support role at the Mississippi Test Facility. This action came shortly after an angry section from Rep. Ryan, when George W. Bushnell, NASA procurement director, appeared before the hearing subcommittee on May 3.

"There was no radiation, no statement to the committee on April 9 that there was an intention of an extension on April 16 of extending the contract to include housekeeping," Rep. Ryan said.

When Rep. Ryan asked who made the decision to extend the GE contract, Bushnell replied:

"This decision was made in our top management. I believe. He had to do it. I was not involved and was not even asked."

### Michael Work

Senate committee members pointed out that selection of a firm to do support and service work at NASA's Marshall plant near New Orleans was made through a competitive procedure. Bushnell and the firm of Mason & Hart was selected for the Marshall job after winning some 20 which submitted bids. Some 5 vehicles intended at Marshall will be built and tested at the nearby Mississippi Test Facility.

A prime point in Rep. Ryan's questions to Bushnell concerned the kind of work to be done by GE under the test extension.

"I think that means a very serious question," says Ryan. "I would like to see the point of the extension, whether it has a very peculiar relationship with NASA to begin with and avoid a contract upon which it will make a profit to provide certain services, general services, parking lots. It seems to me that this is a step beyond the purpose of GE."

Bushnell defended the contract extension. "In the group that it would be much simpler and easier for NASA to deal with one contractor responsible for all activities at the Mississippi Test Facility than two or more," he said. "He also pointed out that GE had performed under management contract for the Atomic Energy Commission and other government agencies.

Bushnell said most of the housekeeping functions such as operation of safe rooms, fire-fighting equipment and plant protection, would be performed by sub-contractors. Later, NASA officials said

**FUZE ENGINEER FOR SPACE INTERCEPTORS**

An expert in anti-satellite weapons systems and technology is offered an exceptional opportunity to conduct his studies for space interceptors at Hughes Advanced Projects Laboratory.

While having experience would be helpful, it is not mandatory. Broad general technological knowledge and logic interest is the subject in regard.

The assignment will entail performing analysis of a wide variety of failing systems (prior failures, materials, and 2) taking into account unusual situations, necessary improvements and possible countermeasures.

If you hold an accelerated degree and U.S. Citizenship and feel that you are qualified by professional experience and interest, please contact your employment resource to:

from, and expand in the company as well as in the future of Bell Helicopter, manufacturer of the Bell 47. No announcement was made of his retained executive management of the Bell 47, with exception of a state merit that Bellanca will have general responsibility to the Hawker Siddeley Group for complaints, but not as executive manager.

Divisions heads are Art Marshall for Helo, Bradford A. Anschelbach, with C. Bay as general manager, and R. L. Laddie, chief executive of Hawker Helicopters with E. G. Reiter as general manager.

The other new companies are Hawker Siddeley Holdings Ltd., to hold all interests in a number of smaller companies trading in advanced products headed by Sir Arnold Hall, and Hawker Siddeley International Ltd., to hold all Hawker Siddeley sales companies, with A. S. Kennedy, director of sales, as chairman.

New member of the Hawker Siddeley Group board is Sir Sidney Green, director of the Hawker P. 1177 VTOVL strike fighter.

### Grumman Sales Expected to Rise

New York—Sales this year for Grumman Aircraft Engineering Corp. are expected to continue to move above \$400 million—probably because of increased F-104A Hawks and A-6A Intruders. New aircraft sales and not from an effect of the ban on TTX variable-geometry wings, lights.

Unlike previously employed cost-type

estimates for development programs in which sales are intended as costs are incurred, the executive board said, cost for TTX will never be likely to not be exceeded by the cost of the aircraft.

Towle said that Grumman sales in the first six or 12 months will not be affected by the ban on TTX variable-geometry wings.

Unlike previously employed cost-type estimates for development programs in which sales are intended as costs are incurred, the executive board said, cost for TTX will never be likely to not be exceeded by the cost of the aircraft.

Grumman has no unique record in the aerospace industry of showing a profit every year of 15 years of existence and probably has an unhealthy record of paying yearly cash dividends to stockholders.

Despite growth in business, Grumman plans no increase at the moment in its \$1.36 annual dividend.

anthon for NASA of LEM as a lunar logistics vehicle.

Of Grumman's projected 1963 sales, military aircraft will contribute about 60%, civil and space sales are expected to run from 10% to 16% and 30% of the total will be about \$12 million. Besides LEM, Grumman is continuing its NASA Orbital Astronomical Observatory scheduled to be checked out at a prototype stage by August and launched in late 1964 or early 1965.

Breakdown of the company's 1963 sales in percentages, as given by Towle, includes the following:

- Early warning aircraft, the E-3A and E-10 (FWB-21-10%)
- Observation, reconnaissance, and attack aircraft, the OV-10 Mohawk and A-6A Intruder—40%
- Anti-submarine and utility aircraft the S-2F Tracker and the HS-125 Albatross—10%
- Space—15%
- Commercial—3%

Grumman's commercial projects include the Ae-Cat agricultural airplane, whose sales of 62 aircraft last year exceeded total previous deliveries of the airplane, and the twin-turboprop-powered Goblet, of which 15 were sold. Grumman's total 1962 aircraft sales were 248 aircraft, 125 military, and 123 civilian; contributions for foreign sales under Air Force contract.

California sites reached a total of 109 in May, and customers include the state's private corporations, the U. S. Coast Guard, NASA, and the Federal Aviation Agency.

Grumman's projected increases in profits for 1963, but higher interest charges will offset some of the projected benefit of cost reduction programs. Because of higher depreciation expected in 1963-\$10 million as against \$7.5 million last year, Bell said Grumman is planning to implement working capital to handle its growing volume of business with a \$10-million long-term borrowing agreement. It will not be through equity financing, however, Towle said.

Proposed Dept. of Defense profit guidelines should not affect Grumman's profits, Towle said, since the current level is relatively modest. Towle believes the accompanying performance rating system should evaluate Grumman's costs in the framework of the company's past record of meeting delivery standards and targets.

Grumman has a unique record in the aerospace industry of showing a profit every year of 15 years of existence and probably has an unhealthy record of paying yearly cash dividends to stockholders.

Despite growth in business, Grumman plans no increase at the moment in its \$1.36 annual dividend.

### Shifts at MSC Define Management Areas

Houston—Definitive division of management responsibilities, separating up-front design from development, action has been announced by Dr. Robert C. Gilruth, director of the Manned Spacecraft Center here.

Walter G. Williams, second deputy director for mission requirements and flight operations last November (AW Nov. 26, p. 25) will develop mission plans and sales over training ground support and mission control complexes and manage all flight operations as director of MSC. Concentrations, Williams will act as director of flight operations in the space agency's Office of Manned Space Flight, Washington, D. C.

He reports directly to D. Bruce and Phillips in that capacity and has authority to make autonomy decisions during flight tests of Mercury, Gemini and Apollo spacecrafts.

James G. Elam, second deputy director for development and program earlier this year, will manage all MSC research space flight projects, including total project planning.

In addition to this duty, Elam will also organize and direct center activities providing administrative and technical support for the entire MSC operation.

Reporting directly to Williams under the new arrangements will be G. M. Pearce, MSC manager of Atlantic Missile Range operations and director, pre-launch operations; Dr. Christopher C. Kraft, Jr., overall flight director; Dr. Warren J. North, chief flight crew operations; Dr. Charles E. Wieden, MSC manager of White Sands Missile Range operations; G. Ben Goren, assistant director for information and control systems, specifically to implement the integrated Mission Control Center (IMCC) and the ground operations support function (GOSB); and Kenneth S. Kleckowich, manager, Project Mercury.

Project Mercury personnel soon of whom will probably be absorbed in the mission requirements and flight operations, will be transferred to the new center on completion of the planned Mercury flights, report to Williams.

Reporting to Elam under the new organizational structure are Manned Space Flight assistant director for engineering and development; G. Ben Goren, assistant director for information and control systems (other than IMCC and GOSB); Wesley Hymel, assistant director for advancement; Robert G. Polson, acting Apollo spacecraft project manager; and Charles G. Mathews, acting Gemini project manager.

### CONTROL SYSTEMS ANALYSIS FOR DEEP SPACE SYSTEMS STUDIES

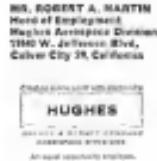

Important opportunities have been identified at Hughes for participation in many different areas of deep space systems studies. These include the use of state-of-the-art techniques in studies on systems which will be based on entirely new data.

These will cover preliminary design studies, analysis of system requirements, system design, trace of system architecture and configuration studies.

Activities will include system analysis, computer simulations, error analysis, parametric studies and similar functions.

From its fifteen years' experience in the same or allied field it is desirable that Hughes design an adequately diversified research and development program.

For immediate information, contact: Mr. Robert A. Martin, Manager, Hughes Aerospace Division, 1160 W. Jefferson Blvd., Culver City 39, California.

## EQUIPMENT

INTERIOR VIEW of advanced moon camera test chamber (left) shows plenum frame. Right: satellite in breach chamber (right).

## Simulator Tests Advanced Recon Systems

Dayton, Ohio—First tests involving U.S.-Advanced Systems Dev's recently completed moon camera simulation facility for testing advanced reconnaissance systems have been completed successfully at Wright-Patterson AFB here.

Facility, nicknamed "Sally's Castle" after Project Engineer James Hayes who proposed it five years ago, is designed to conduct dynamic analysis of infrared, photographic and television reconnaissance systems for air and space vehicles in extreme environments prior to test flights.

In the past, advanced reconnaissance systems had to be tested in flight programs which at times cost the mission itself. The dynamic testhouse is expected to reduce test costs by 50% and allow a predictable test sequence.

One of the primary contributions in the design of the facility was relative to "dose base," between tests of different areas of responsibility. Around each, the pressurized chamber was designed to accept quick-change plug-in bases mounting test equipment. Complete installation of new equipment requires about two hours.

Upon completion of a test, data is recovered from the recording area and sent to the data reduction section for analysis, leaving the facility free to accommodate new equipment. In the meantime, new equipment previously mounted in the test fixture ready for "winging it" in the environmental chamber. ASD has plug-in fixtures.

Control speed, target and altitude

simulator for both cameras and television cameras are mounted in a circular platform which is rotated inside the chamber. Images from the target simulator is projected onto the environmental chamber through openings in the bottom.

Target cart contains complete optics,

### Thermodynamics Lab

North American Aviation Contractors Division recently opened a \$2.5-million Thermodynamics Laboratory for testing heat sinks and waste heat rejection in simulated high altitude and insulating reheat.

The laboratory houses a 10-ft. by 10-ft. waste heat chamber, two other large test chambers and three smaller ones.

The two large chambers are used to evaluate complete aircraft venting and air conditioning systems, pressure suits, electronic cooling devices, waste heat rejection and deionizing systems.

These smaller chambers are used for quick and efficient test of heat sinks and waste heat rejection, and NAVFAC production development experiments.

The main test chamber has a 32 x 12 x 40-ft. work space, and is capable of temperatures between -70F and 900F, can simulate altitudes of 100,000 ft.

High temperatures are achieved by heating air with two 100-kw resistive elements and circulating it with a 200 hp blower. Low temperatures are achieved by cooling 3,000 gal. of air ethylchloride with dry ice.

target control and other equipment needed for complete thermal analysis, including a 100-kw blower. Insulated target cart has air horn coupled.

Test chamber consists of a 54,000-lb stainless steel platform load with 23 stainless steel skin containing heating elements and passage for cooling. The skin can be individually temperature controlled to conduct the equipment with temperatures ranging over -100F to 900F from different quarters simultaneously.

Pressure in the chamber can be reduced to 10<sup>-4</sup> mm. Hg. At 100 mm. Test equipment immersion 6 x 10 ft. can be accommodated.

To speed testing, further stations should benefit from the chamber will support two parallel test programs, mobile target carts for test items not involving rotation or vibration insulation.

Chamber movement is determined by six hydraulic actuators positioned outside which control roll, pitch and yaw. Maximum pitch and roll is  $\pm 15$  deg and yaw is  $\pm 2$  deg.

Within the chamber cluster of three hydraulic actuators, mounted radially perpendicular, are connected to the four corners of the plenum frame. For vibration testing, vibration test caps which extend from 2 to 500 cps with a maximum displacement of 3 in. at  $\pm 3$  g.

Fast test, on a 100,000-camera with a 12-in. focal length, simulated an altitude of 65,000 ft. at -41°F under conditions of three evaporation in upper state a repeat high 300-lb reson-

## NEW AEROSPACE PRODUCTS

### High-Pressure Paint Heater

Aerosol high-pressure heater maintains paint at ambient temperatures and viscosity at pressures up to 3,000 psi, the manufacturer reports.

The system is capable of heating

varnish, acrylic and other heavy-bodied coatings for aircraft and missile structures.

Heater control of paint temperature is accomplished whether or not paint is flowing through the system.

Constructed of aluminum, the 451-6902 units require 1.5 and 4 kw of power.

Spec-Flu Co., 6844 Elringburg Blvd., Houston, Tex.

### Miniture Inspection Camera

Miniture camera and video fully-into-camera inspection of inaccessible holes and slots for aircraft, rocket nozzles, canisters, wells, pipelines and turbines. The instrument, called a CineScope, incorporates fiber optic viewing through a 10x lens. It is 100% braided stainless-steel cable up to 20 ft long.

Camera has 5 mm color or black and white film enlargeable up to 100 mm and takes 6-11 frames/second or 12-26 single exposures without reloading. Lens system is a modified Tessar triplet with 80 deg. wide angle at f/16 with a resolution of 0.005 in at 14 in. length of field. View coverage is 160 deg. Field of view at maximum depth of 12 ft. Exposure is in electronic form. An integral flash and shutter operates at 30 x rays in 2.5 ms. field. Camera is 5 in. long, by 1.75 in. in. dia. and weighs 1.6 oz. less housing.

Inte-Cam Corp., 355 Boston St., Lynn, Mass.

### Welding Head Manipulator

Model 12 x 12 cartridge manipulator, automatically controlled from operator's push button pedestal, is designed to

hold each part, internal and external fasteners, or nozzle cases, oxygen tanks and similar equipment.

Any type welding head can be mounted on the manipulator. Most fast tools are accepted on a 4-point thrust bearing using a rail-type car to provide 360 deg. rotation. Manipulator

vertical boom height a 12 ft. minimum range is 3 ft. Horizontal boom travel is 12 ft. Manipulator and car speed are variable between 5-200 in./min. Boom and car are powered by a 230V 440-cu-in. motor. The manipulator weighs approximately 7,000 lb. and is 16 ft. high overall.

Lewis Welding & Engineering Co., Schenectady, N.Y.

### High-Pressure Oil Filter

Model 8100-100 filter operates at up to 25,000 psi with flow rates of 12 gpm. The filtered filter is designed for use with hydraulic oils. Filter elements which will remove impurities

from 510 microns in the oil be changed without removing the filter from the system.

Filter measures 5.6 in. high by 4 in. dia. inlet, outlet, and bleed connections are 1/4 in. female pipe thread, standard.

Flow rate is with a 10 micron element and 1000 psi at 100°F, 100 psi at 12,000 psi, 25 psi at 6 gpm and 5 psi at 1 gpm.

Spagener Engineering Corp., 19160 So Vermont Ave., Gardena, Calif.

### High-Torque Fastener

External retarding, split-dome threaded fastener is designed for aircraft and missile assembly.

Repetitive stress notched fatigue at tensile strengths of 760,000 psi without splice deterioration or wear-fatigue reported by the manufacturer. Planks of the 6-1610, 16 point spline are at 90 deg with the lathe cutouts fully utilizing bearing surfaces to achieve a degree of protection previously unachieved and claimed by the manufacturer, which stress concentrations have been reduced to the manufacturer's satisfaction. Manufacturing into removal of fastener under tensioning conditions resulting from high temperatures and extreme temperatures where removal torque exceeds installation torque is possible.

Spagener is available on the Avionics and Aircraft Fastener line.

Alfa Manufacturing Co., Hartford, Conn.

### Exhaust Shielding Material

Modified phenolic polymer called NML 1040 withstands a flame temperature of 6,500°F 8 in. from for 60 sec with a sustained loss of 1,027 in. per sec, the manufacturer says.

The erosion protection material bonds to the metal substrate, plus fiber, quartz and phenolics using the manufacturer's private Specular 10-2 insulation. Technology Inc., 9942 Don Way, Camarillo, Calif.

### Anti-Backlash Differential

Mechanical differential TS-9 is designed for computers and servo applications.

Zero backlash is maintained by snap-loaded bevel gears, regardless of

from 510 microns in the oil be changed without removing the filter from the system.

Filter measures 5.6 in. high by 4 in. dia. inlet, outlet, and bleed connections are 1/4 in. female pipe thread, standard.

Flow rate is with a 10 micron element and 1000 psi at 100°F, 100 psi at 12,000 psi, 25 psi at 6 gpm and 5 psi at 1 gpm.

Spagener Engineering Corp., 19160 So Vermont Ave., Gardena, Calif.

### High-Torque Fastener

External retarding, split-dome threaded fastener is designed for aircraft and missile assembly.

service conditions or temperature changes for aircraft lifetime, according to the manufacturer.

Starting torque increases slightly from 36 to 6 in-lb using this type gear depending on how many teeth are rotated to load the spring. Use can increase up to 15 in-lb torque at 10 rad/deg.

Spagener is available on the Avionics and Aircraft Fastener line.

## SCIENTISTS ENGINEERS

Consider the following challenging opportunity currently available:

### RECRUITER SCIENTIST

Requirements: BS in AE or ME with 10 years experience in aircraft design and/or aircraft maintenance. Should have extensive aircraft maintenance experience and excellent analytical skills. Experience in aircraft design and/or aircraft maintenance. Must have experience in collecting information and analyzing data. Must be able to understand and interpret written material.

### AIRCRAFT RESEARCH AND DEVELOPMENT ENGINEERS

Requirements: BS in AE or ME with 10 years experience in aircraft maintenance or aircraft design. Should have extensive aircraft maintenance experience and excellent analytical skills. Must have experience in aircraft design and/or aircraft maintenance. Must have experience in aircraft design and/or aircraft maintenance.

### PRODUCTION DESIGN ENGINEERS

With any of the following backgrounds: BS in AE or ME in Aircraft or Aerospace Engineering with five years experience in aircraft design and/or aircraft maintenance. Should have extensive aircraft maintenance experience and excellent analytical skills. Must have experience in collecting information and analyzing data. Must be able to understand and interpret written material.

### PROTOTYPING DESIGN ENGINEERS

With any of the following backgrounds:

BS in AE or ME in Aircraft or Aerospace Engineering with five years experience in aircraft design and/or aircraft maintenance. Should have extensive aircraft maintenance experience and excellent analytical skills. Must have experience in aircraft design and/or aircraft maintenance.

### AERODYNAMICS ENGINEERS

BS in AE or ME with experience in aircraft design and/or aircraft maintenance. Must have experience in aircraft design and/or aircraft maintenance.

### AIRCRAFT STRUCTURES ENGINEERS

Bachelors degree, license granted by appropriate state or national association, and extensive aircraft design and/or aircraft maintenance experience.

### LIGHT TEST ENGINEERS, SENIOR

Requirements: BS degree in aircraft or aerospace engineering or equivalent, and extensive aircraft maintenance experience. Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

Must have experience in aircraft design and/or aircraft maintenance.

The S1 series thermometers have 100 ohm element resistance of 10, 100 or 1000 ohms.

The unit is designed for capsule, gimbals, and accelerometers temperature sensing and laboratory and aircraft pressure control, according to the manufacturer.

Micro Products, Inc., 740 Wadsworth Avenue North, Minneapolis 1, Minn.

## Aeronautical Engineers:

If you want to do research work on advanced aircraft concepts

## Join the TRECOM team

YET, we need AIRCRAFT. Because we—the Army's Transportation Research Command (TRECOM)—want to test from only those engineers who are truly interested in researching the future of advanced aerospace vehicles. No missiles, solar power, or computers. Just one-on-one high performance helicopters, VTOLs, and STOL aircraft, and exotic multidimensionally-controlled aircraft vehicles.

That's the sort of aerospace aircraft that will be extensively needed for troop transports, surveillance, logistics, and special mission—any of which will have a bright future on the commercial marketplace as well. Here are some of the projects in the works at TRECOM today:

• A flexible wing vehicle capable of being packed into a package and space will be used by airborne combat troops for speedy, directed attack. • The XV-44, VTOL aircraft uses a unique, high performance, high lift system to achieve speeds. • A new Hot-Capte Precision Jet Fector System necessitates a revolutionary technique for increasing endurance, speed and payload. • Small mobile lift devices (Project Rollo) have been tested by propelling a man through a series of low-level obstacles.

Artists' concept of compound helicopter  
90% are a sort of "flying car" of machines—easier to live and work right on the floors of Verginia's beautiful new historic Tudor-style Virginia—widely known as the "Home of the Presidents" and Workmen. Already we have more demands than can accommodate them, we are short, and have immediate need for engineers—especially in

If you are interested in basic and applied aerospace research, please get in touch with Mr. L. B. Epp, Director Personnel Office, starting salaries up to \$31,845, plus all the benefits of Civil Service.

**U.S. ARMY TRANSPORTATION RESEARCH COMMAND**  
**TRECOM**

Fort Eustis, Virginia

## WHO'S WHERE

(Continued from page 18)

### Honors and Elections

Dr. Ludwig G. Lofken, medical director of *Aviation Safety* has received the Army Space Medical Award's Howard R. Edwards award for outstanding service in the practice of aerospace medicine.

Gen. Gen. James M. Gavin (USA, ret.) has been elected president of the Army's Transportation Research Command. Gen. Gavin is president and chief executive officer of Aebar (D) Little, Inc., Falls Church, Va.

Col. John W. Miles Jr. (USA, ret.) has received the Army's First Voter Award for "young front legislation" a Vietnam army post, and "leading his cockpit plane."

William J. Gavitt has been elected president of the American Assn. of Airport Executives. Mr. Gavitt is superintendent of airports for Tampa, Fla.

### Changes

William C. Jennings, executive director of the Federal Aviation Agency's Regulatory Council, succeeded Lloyd Lane (AWW May 6, 1971).

Gen. Gen. Henry W. Vanisola, commander of Technical Air Command's 19th Air Force, succeeded John C. N. C. of July 1. Major Gen. George W. Clegg, Jr. succeeds him under TAC's Ninth Air Force, Mac Dill AFB, Fla., in July.

Dr. F. Leland Vogel, Jr., joined Spacecon's Research Dept., Sprague Electric Co., North Haven, Conn., as Vice President, Space and Defense. Dr. Vogel, formerly with the Space Division, Hughes Aircraft Co., Culver City, Calif., has joined George C. Cragin, Jr., to direct company work consonant with the company's recent agreement to collaborate with Hughes' Solid State Division, Ltd., in the VSTOL research field.

T. C. Parks assumed general manager responsibilities for operations Boeing Co.'s Vertol Division, Philadelphia.

T. C. Lee, technical director of power systems for the newly formed Research and Development Div., Lockheed-Mitsubishi Co. Space Co., Sunnyvale, Calif.

Adrian E. Abel, manager Communications Div., Hughes Space and Communications Co., Chatsworth, Calif.

Ugoz C. Consalvi, associate director of engineering, Materials Change (R), Military Electronics Center.

Frederick H. Shuster, still engaged in demanding development, Aircraft Engine Division, Allison Div. of General Motors, Indianapolis, Ind. Charles E. Dennis succeeds Mr. Shuster as vice president and general manager, Engine Division.

James F. Van Riet, director, Aerospace Systems Laboratory, ITT Federal Laboratories, Middle, N.J., a division of International Telephone and Telegraph Corp.

James C. Staudt, director of Air Force and Advanced Materials Division, Northrop-Northrop, a division of Northrop Corp.

James H. Cudley, manager, Airframe Requirements Control Division, Electronics, San Diego, Calif., and Robert R. Pines, manager, aircraft purchasing.

# COLLINS CALL

### ... today's promise . . .

To creative scientists and engineers the tasks assigned to CHRYSLER Corporation SPAC Division hold out a tempting lust.

A prime contractor on the long-range SATURN I Space Program, Chrysler has been assigned added responsibilities for ADVANCE ENGINEERING and PRODUCT IMPROVEMENT.

Chrysler's long record of experience and success in the aerospace field coupled with exciting present and future missions add up to the invigorating professional environment as sought after by the thoughtful.

If you look beyond today's promises to the horizons of tomorrow, a career with Chrysler can carry you to the full extent of your potential.

### tomorrow's fulfillment . . .

Chrysler activities on the Satcom I are divided among three congenial and pleasant Southern locations—NEW ORLEANS, HUNTSVILLE, and CAPE CANAVERAL.

If you have a degree and experience in one or more of the disciplines listed on the page opposite, investigate the potential of a career with Chrysler.

Send your resume in complete confidence to Section A-1, Personnel Department, at the location of your choice:

P.O. Box 26078, New Orleans 28, La.  
 P.O. Box 857, Huntsville, Ala.  
 1111 Sheridan Road, Melrose Park, Ill.  
 An equal opportunity employer

SPACE DIVISION

### ADVANCE ENGINEERING

**AUTOMOTIVE SYSTEMS**—Advanced Systems Engineers—work on the basic design of automotive systems. Responsibilities include power transmission, suspension, steering, and brakes. Also, a team of engineers is assigned to the development of advanced and unique components. Flight attitude, steering, collision avoidance, and safety systems are other areas of responsibility. The team also designs and develops systems for aircraft, space vehicles, and ground vehicles. The team also designs and develops systems for aircraft, space vehicles, and ground vehicles.

**ELECTRICAL AND ELECTRONICS**—Electrical engineers design systems for nuclear reactors, aircraft, and space vehicles. Responsibilities include power generation, distribution, and control systems. Also, responsibility for the design of electronic components, such as transistors, diodes, and integrated circuits. The team also designs and develops systems for aircraft, space vehicles, and ground vehicles.

### LAWRENCE FELLOWS

Environmental control systems (Space Station design) includes air conditioning, waste, water, oxygen, and thermal control. Also, a team of engineers is assigned to the design of aircraft, space vehicles, and ground vehicles.

### MACHINERY

Design, development, and production of aircraft, space vehicles, and ground vehicles. Responsibilities include design of aircraft, space vehicles, and ground vehicles.

### STRUCTURAL

Design, development, and production of aircraft, space vehicles, and ground vehicles. Responsibilities include design of aircraft, space vehicles, and ground vehicles.

### QUALITY CONTROL

Supervise quality control activities in the aircraft, space vehicles, and ground vehicles.

Supervise quality control activities in the aircraft, space vehicles, and ground vehicles.

### STRUCTURAL, PROPULSION, AND RELATED ENGINEERS

Structural, structural dynamics, propulsion, and related engineers are assigned to the design of aircraft, space vehicles, and ground vehicles.

Structural, structural dynamics, and related engineers are assigned to the design of aircraft, space vehicles, and ground vehicles.

### STRUCTURAL, PROPULSION, AND RELATED ENGINEERS

Structural, structural dynamics, and related engineers are assigned to the design of aircraft, space vehicles, and ground vehicles.

Structural, structural dynamics, and related engineers are assigned to the design of aircraft, space vehicles, and ground vehicles.

### STRUCTURAL, PROPULSION, AND RELATED ENGINEERS

Structural, structural dynamics, and related engineers are assigned to the design of aircraft, space vehicles, and ground vehicles.

# UNIVAC

## SYSTEMS ENGINEERS AND SPECIALISTS

Military systems design requirements of UNIVAC SPAC Division provide several challenges for high-level engineers with the ability to work in a team-oriented environment. Thus, two senior engineers and two staff engineers, plus one test engineer, will be assigned to the UNIVAC SPAC Division's Advanced Systems Engineering Department. This team will be assigned to the design of one of a variety of other military programs, possibly requiring a contract with one or more companies.

### ELECTRICAL AND MECHANICAL ENGINEERS

Engineering design experts will work with engineers on digital logic, memory design, to obtain optimum, reliable, compact, and cost-effective systems and electronic components.

### COMMUNICATIONS AND RADAR ENGINEERS

Engineering design experts will work with engineers in microwave components and systems, and in the design of communications and radar instruments. Also, design experience in several specific microwave applications.

### DISPLAY ENGINEERS

Engineering design experts will work with engineers in displays, including liquid crystal displays, and in the design of displays for aircraft, space vehicles, and ground vehicles.

### MILITARY OPERATIONS

Engineering design experts will work with engineers in the design of military systems for both aircraft and ground vehicles.

### ANALYSTS

Software design and testing engineers, along with experience in graphics, will work with engineers in the design of military systems for both aircraft and ground vehicles.

### PROGRAMMING

Engineering design experts will work with engineers in the design of software for aircraft, space vehicles, and ground vehicles.

### QUALITY CONTROL

Supervise quality control activities in the aircraft, space vehicles, and ground vehicles.

### STRUCTURAL

Engineering design experts will work with engineers in the design of aircraft, space vehicles, and ground vehicles.

### STRUCTURAL, PROPULSION, AND RELATED ENGINEERS

Engineering design experts will work with engineers in the design of aircraft, space vehicles, and ground vehicles.

### STRUCTURAL, PROPULSION, AND RELATED ENGINEERS

Engineering design experts will work with engineers in the design of aircraft, space vehicles, and ground vehicles.

### STRUCTURAL, PROPULSION, AND RELATED ENGINEERS

Engineering design experts will work with engineers in the design of aircraft, space vehicles, and ground vehicles.

Manager  
Advanced Systems  
Technology  
to \$25,000

PhD as  
representative  
with experience  
in engineering  
disciplines, e.g.,  
space plasma, astrophysics,  
electronics, communications,  
structures & materials, aerothermodynamics,  
aircraft design, and computers  
in reliability & quality control.

This selected SPAC organization plans  
staff and directs a multi-disciplined  
technology department whose objectives  
are:

(1) the advancement of the state of the art  
in the advancement of the state of the art.

(2) the rendering of technical services  
to systems engineering and  
operations through design efforts.

... at AVCO/RAD

Start in the most vital work in solving aerospace problems. AVCO/RAD is growing in proportion to the nation's aerospace and missile requirements. Avco's leadership offers engineers a genuine opportunity to participate in a number of home-and-new projects which demand creativity and stimulate your professional growth.

Assignments embrace all kinds of engineering disciplines and our major laboratories are working on such programs as APOLLO, TITAN, MINUTEMAN, MIRAGE, and other classified projects.

Opportunities Exist in the Following Areas:

## THERMODYNAMICS

- Heat Shield Analysis & Design
- Temperature Control Systems
- Rocket Motors

## GUIDANCE & CONTROL

- Space Flight Control
- Attitude Control Guidance
- Attitude Control Systems
- Gas Hydrides, Electro Mechanical Servos

## MATHEMATICS

- Applied Analysis
- Discrete Mathematics
- Numerical Analysis
- Programming

## SPACE FLIGHT-TEST TECHNOLOGY

- Structural Mechanics
- Aerodynamics
- Structural Evaluation
- Structural Analysis
- Test Range Technology

## AERODYNAMICS

- Theoretical Aerodynamics
- Aerodynamic Design
- Aerodynamic Development
- Experimental Aerodynamics

The Division's facilities are located in Waltham, Mass., Lowell and Lawrence, east north of metropolitan Boston. At AVCO/RAD you are close to leading universities, cultural events and excellent recreational facilities.

Send resume to:  
Mr. J. Berger,  
Dept. QTS

**Avco**  
Avco & Advanced Technology

A Division of Avco Corporation  
201 Lowell St., Waltham, Mass.

An equal opportunity employer.

POSITIONS VACANT  
Exhausting Positions for RR or RR with Avco.  
Detailed Avco Instrument manufacturers  
highly skilled precision instrument and  
electronic assembly technicians. Work at  
Westover Air Force Base, Worcester, Mass.  
Avco Electronics

Avco Avionics and Mechanics. We are now  
interested in applicants with a good degree  
in Electronics or a related field. We are looking  
for people that can work in a team environment.  
Avco Electronics Division, Inc., 10000 Federal  
Highway, Ft. Lauderdale, Florida 33304. Call 305-737-1122.

## POSITIONS WANTED

Corporate Defense Systems Division, Inc.  
is seeking Entry Level and Postbaccalaureate  
graduates with the equivalent. Positions in  
the following areas: Avionics, Communications,  
Electronics, Guidance, Instrumentation, Radar,  
Space, Test, and Weapons. Send resume to:  
10000 Federal Highway, Ft. Lauderdale, Florida  
33304. Tel: 305-737-1122.

Post Avionics, Avionics, Transport Systems  
Division, 10000 Federal Highway, Ft. Lauderdale,  
Florida 33304. DDCI, Control, Test, Trans-  
port, Communications, Radar, Space, Test,  
Weapons.

An entry level Avionics Systems engineer  
with Doctorate, Mathematics, Mathematics  
and Physics, or equivalent, and five years  
experience in engineering management on  
Space Programs. Tel 305-737-1122, Avco Electronics  
Division, Inc.

## MAJOR OPPORTUNITY WANTED

Lower-level position immediately with  
corporate management and basic design  
and/or test experience. Send resume to:  
10000 Federal Highway, Ft. Lauderdale, Florida  
33304.

"Put Yourself in the  
Other Fellow's Place"

## TO EMPLOYERS

## TO EMPLOYEES

Exhibit Number 10000 Federal Highway,  
Ft. Lauderdale, Florida 33304. We are  
able to provide you with a detailed  
description of our company and  
the opportunities available to you.

Mr. KIRKWOOD, will be happy to  
discuss the many opportunities  
available to you. Call him at 305-737-1122  
and let him tell you the Avco difference.

Mr. STROBLER, will be happy to  
discuss your qualifications and let you  
know if you are qualified for  
the many opportunities available to you.

Mr. STROBLER, will be happy to  
discuss your qualifications and let you  
know if you are qualified for  
the many opportunities available to you.

This message will be the same each time  
it is a result of this communication.

## Senior Electronics Staff Openings at Boeing

Senior level positions are now open on Boeing's Electronics Technology Staff. Assignments involve the support of advanced space programs of the future through applied research, theoretical analysis, and advancing the state-of-the-art in the following areas:

**MICRO-ELECTRONICS** - space packaging concepts, thin film techniques, lead-free solder, model fabrication and evaluation.

**GUIDANCE CONTROL SYSTEMS** - precision guidance, track/aim, center point control, navigation, system integration, accuracy and weight for vehicle configuration parameters.

**COMMUNICATION SYSTEMS** - failure analysis, electrical interferences, space-to-space, preliminary configuration design.

**COMPUTER ELECTRONICS** - advanced concepts and design techniques for high speed digital and analog computers, development of solid state instruments/electronics circuitry.

**BOEING**

Divisions: Military Aircraft Systems • Transport • Verbi • AERB-SPACE • Industrial Products • Boeing-Scientific Research Laboratories

AVIATION WEEK & SPACE TECHNOLOGY, May 27, 1963

PROPULSION SYSTEMS  
ENGINEERS

North American Aviation's Space and Information Systems Division is starting its fast growing Propulsion Systems Department. Professional engineers and scientists of exceptional capability are needed to solve propulsion problems for America's most challenging aerospace programs.

## ROCKET DEVELOPMENT

Jobs will consist of planning and directing experimental development of liquid rocket engines or solid propellant rocket boosters. Requires thorough knowledge of rocket design, and the use of experimental techniques and proficiency in interpreting test data.

## PROPULSION SYSTEMS DESIGN

Experience in one of these areas is required: Rocket engine installation, system propellant and pressurization, system design, design of high performance fluid-weight components such as valves, regulators and controls. Positions require competence in high stress design, reliability and value engineering principles, thorough knowledge of materials and their compatibility with propellants.

Other available positions include test systems development, and project engineers. Direct your resume to Mr. E. B. Marshall, Engineering and Scientific Employment, Department 8200, 13234 Lakewood Blvd., Downey, California.

All qualified applicants will receive consideration for employment without regard to race, color, gender or national origin.

SPACE AND INFORMATION  
SYSTEMS DIVISION

North American Aviation

## LETTERS

## G. De-Bugged

Millett enterprise (Overall Dynamics) Contact lab tests and tests I carried out at the Philips Petroleum Co. refine results. Well, our statement that "The increasing addition of PA157MBI" may or may not inhibit growth of micro-organisms, but it does need to reduce the Benz N Content and should be used with caution if at all" (PAW May 5, 1980).

The military has used the additive for many years and no top coating degradation has been reported. Performance tests using PFA151M in the recommended proportions show no softening or loss of bonding. Expenses to date show that of the subject additive is used in recommended proportions it is an effective bonding

Ward-Venturini  
Senior Design Engineers  
General Dynamics/Convair  
San Diego, Calif.

### *Cosmos Questions*

The article appearing in *Aviation Week* on April 29 is 221 and in the *New York Times* on May 4, wherein a review of comments made by T. F. Knott of the Rose Corp. is given, perhaps there further remarks on the Soviet Census series of 1959.

To begin with I should like to take the opportunity to disagree with Kuiper on the use of the Gemini space vehicles launched as he indicates from the Kepriles Yer 1966 and placed in orbit with a 49 deg. inclination.

tion in the apparent phase. In the en-  
tire 85 flights screened I recovered quite  
early for most epicyclonides greater apparent  
phase errors than the maximum of 10° of phase  
error for all flights, and the maximum of 10° of phase  
error could be observed with the naked  
eye on over 3000 separate occasions provided the  
light was clear. The epicyclonides were  
mostly seen and observations were frequent.  
Several analyses and several long time ap-  
plications of the data for the Cessna 172  
showed that the errors were 1, 2, 3, 5 and 6° in  
size when they would appear.  
Yet at about a dozen  
moments we could see them repre-  
senting that ratio because signals due for 10° in  
10° moments from ground level and time  
considerations that the epicyclonides were not  
seen at all.  
The epicyclonides were  
seen at all times. The first time that  
one was seen was at the day of David Tamm's  
final flight scheduled on September 17, 1958.  
It was quite conceivable that because of  
the time of year, we thought we would have  
longer periods of better time as the solar  
system moved along. The maximum of 10° of phase  
error that is to say 6° as  
an orbital angle. At least, now, the Vostok  
was seen.

It would be to point out that either of these resonance structures is at some anticlinal crest. In Figure 4 and 7 we see "peaks" to Volume 3 and 4, and, hence, with at NASA (unpublished data), we have some more information on the structure and without using any aids.

### A Critic

Give a return of the Republic profile for comments on our April 29 editorial "Spoils and Coats".

Your state of Louisiana's residents is underfed and overfed with technological knowledge and the best of the American and the world's best in the field of agriculture. We are not that foolish. However, we must not let the coast be clear in the 30th session of the United States of America that does not understand even today why we must be fed to the masses or we will go to hell. As great as our country is, we must not let the world's best be sold by our poverty on extremes, those such as, "The Poor of the Poor". You either eat this way, we will follow to the mount". The average citizen asks the same question: Why don't we have the Harvard group in Washington explain to us the reason for the lack of food we have had in the space of a month as we have planned in the present regime.

In your editorial you say that the Apollos is moving closer to its spiritual birthplace. I wish you that you don't need NAMs, the Defense Department, or that书画 group in Washington. The Republic has its reasons of the clear thinking socialist type such as yourself. To me it is natural to speak today of that man who can go to the next application of his political views in the most peaceful, democratic and no, worked in the memory every person because we are not in a hurry to speak, catch up with us but we have no time in such respects a date. Oh, well, I guess I understand it is all based on your real in strictness honest against it would enjoy using the printed in your press!

Lewis E. Hirsch  
Weybridge, N.Y.

## STATUS REPORT ON SELF-POWERED AEROSPACE DEVICES

**Nuclear-Powered Composites:** The availability of a consistent nuclear source has wide possible applications.

carry one grain of deuterium, the self-reproducing component for armament systems. The nuclear source—the Larson-Miles Keyper 89 Battery—contains no inert gaseous isotope not metabolized by the body and easily dispensable in air should the battery be disengaged. As a result, the battery is a very practical as well as reliable unit, delivering in excess of 10,000 volts, charging battery to 1,000 volts, and having an operating life of over one year.

■ As would be expected, the advent of such a power source has been accompanied more recently by a new range of components designed around it. Most of the new Lessons Learned components are aerospace-type triadodecaval, lightweight, self-pervent.

■ **Example 1** The Bauschler® Model 6010P. This is an acceleration-deceleration timer which introduces a time delay when a certain predetermined amount of current is applied to the load. The time constant is 15 seconds and the waveform is limited only to the ground truth before the set value before the device automatically resets itself. With its bright, plus its visual characteristics, the Bauschler® 6010P serves two types of applications, such as class time, emergency illumination, and activation of equipment.

<sup>12</sup> The direct system altitude as a function, has a time delay at the pre-set threshold, then delivers a second. It contains only one moving part and up to 250,000 feet. The application of the Inacorch made stage destruction, stage separation, package and other similar strengthen uses.

new group of self-powered aerospace devices. All are being sterilized by shock, vibration, or temperature for a period of more than 10 years, they offer since the battery life-span is a tenth century, only handling is required. For data on these and many more both long-organized and unorganized, see *Proc. IEEE*, 35.

## WHEN RELIABILITY HANGS BY A THREAD...

Guarantee it with  
Double/Durability\* nuts  
engineered by

**ESNA**

When a high-tensile, fatigue-qualified bolt is specified it's usually because the performance of that particular bolted connection is of critical importance. In such applications the variables (or unknowns) may include alternating tension-compression loads; unpredictable changes in pre-load due to installation techniques or wear-in of structure; variations in loads resulting from the effects of abrupt changes in temperature on dissimilar metals, and unpredictable shock loads. □ Photoelastic studies prove that an ordinary locknut concentrates the load on the lower three bolt threads. When you add to this localized load concentration in the nut (and the bolt!) the variables mentioned above, the bolt can be subjected to punishment that may exceed its performance capabilities, and severely reduce its reliability. □ If the fastening problem or the integrity of the structure requires a high

performance bolt, the simple solution to improved reliability under all conditions is the revolutionary Equa-Stress thread modification used in the new Double/Durability nuts engineered by ESNA. In a Double/Durability nut the stress load is redistributed over *all* the threads of the nut . . . and therefore over a greater bolt thread area. Equalizing load concentration compensates for the unforeseen in installation and service— safeguards vital fastenings. (Equa-Stress thread can be inspected with standard gauges and conventional inspection techniques.)

□ When maximum performance and safety hang by a thread . . . guarantee the reliability of highly stressed connections against the unknown and double their fatigue life with Double/Durability nuts! □ For your copy of ESNA's new "DESIGN MANUAL No. 6226 for HIGH TENSILE FASTENING" write Dept. S83-525.
